

CALIFORNIA ENERGY RESOURCES CONSERVATION  
AND DEVELOPMENT COMMISSION  
ENERGY EFFICIENCY COMMITTEE

PUBLIC WORKSHOP ON THE AB 549 PROJECT  
Possible Mandatory Mechanisms for Improving  
Energy Efficiency in Existing Buildings

CALIFORNIA ENERGY COMMISSION  
HEARING ROOM A  
1516 NINTH STREET  
SACRAMENTO, CALIFORNIA

THURSDAY, OCTOBER 16, 2003

10:00 a.m.

Reported by

Alan Meade

Contract No. 150-01-005

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

A P P E A R A N C E S

COMMITTEE MEMBERS PRESENT

Robert Pernell, Commissioner  
Art Rosenfeld, Commissioner

STAFF PRESENT

Al Garcia, Advisor to Commissioner Pernell  
Bruce Cenicerros  
Randel R. Riedel  
Elaine Hussey  
Residential Buildings and Appliances Office  
Nancy Jenkins, PIER Buildings Program  
Bill Pennington

ALSO PRESENT

Lynn Benningfield  
Cynthia Austin  
Shefali Modi  
Heschong Mahone Group  
Tony Pierce, Southern California Edison  
Lisa Fabula, San Diego Gas & Electric  
Len Bardsley  
Abdullah Ahmed  
Southern California Gas Company  
Dale Gustavson, Air Conditioning Contractors of  
America  
Mike Hodgson, ConSol, California Building  
Industries Association  
Manuel Alvarez, SGE  
Ted Rieger, Indoor Comfort News  
Devra Bachrach, Natural Resources Defense Council  
Paul Dudley, Bristolite Industries  
Cal Broomhead, City and County of San Francisco  
David Calabrese, Association of Home Appliance  
Manufacturers  
Bobbi Glassel, Sacramento Energy Service Company  
Tom Hamilton, CHEERS  
Tom Riley, Cogent Energy  
J. Patrick Quinn  
Anne McCormick, Newcombe Anderson

## I N D E X

Opening Comments, Commissioner Pernell	1
Proceedings	2
Introductions	5
Overview of Events and measures report	14
Explanation of events/measures tables, criteria for selecting measures, desired input from participants	22
Discussion Period	27
Residential Opportunities	27
Multifamily Opportunities	58
Commercial Opportunities	86
Overview of key focus areas	96
Discussion Period	
Areas for expansion of building and appliance standards	99
Rating the efficiency of existing buildings and evaluating cost effective improvements	108
Home energy ratings	108
Commercial retrocommissioning	141
Encouraging use of controls, and the role of tariff and demand response programs	160
Encouraging local retrofit ordinances	178
Other areas	191
Summary and next steps	197
Adjournment	206
Reporter's Certificate	207

1 P R O C E E D I N G S

2 COMMISSIONER PERNELL: Good morning. I  
3 want to welcome everyone, and thank you for taking  
4 time out of your busy day to share some of your  
5 knowledge and experience with us today. The AB  
6 549 Project -- that's what we're calling this --  
7 basically was some legislation that kind of  
8 directed us to do a study on existing buildings.

9 And we're investigating ways to reduce  
10 energy consumption on existing residential and  
11 non-residential buildings. And this is the second  
12 -- and I know Bruce is going to tell you this --  
13 but this is the second of three workshops that  
14 we're going to have.

15 The electricity shortage of 2000-2001  
16 kind of underscores the critical balance that we  
17 have between supply and demand in California. All  
18 of the new buildings in California are much more  
19 efficient than those built before we had the  
20 comprehensive building standards.

21 And so what we want to do here is try to  
22 identify some energy savings on existing  
23 residential and non-residential buildings. We  
24 hope that AB 549, the process, yields some new and  
25 creative solutions in this area, and we view this

1 as a very important effort, and again we value  
2 your input.

3 With that I -- by the way, my name is  
4 Commissioner Pernell, I chair the Energy  
5 Efficiency Committee; my colleague, Commissioner  
6 Rosenfeld, is also a member of that Committee.  
7 And I will just ask the Commissioner if he has any  
8 remarks at this time?

9 COMMISSIONER ROSENFELD: Just welcome.

10 COMMISSIONER PERNELL: All right. At  
11 this time we would like to turn the workshop over  
12 to Bruce, who will be conducting the workshop  
13 today. And this is kind of informal in that we  
14 want to hear from you. You can relax, this is not  
15 so structured, you know, we're just common folks  
16 up here. And no idea or no question is a bad one.  
17 So let's just try and flesh this out. With that,  
18 Bruce?

19 MR. CENICEROS: Thank you, Commissioner.  
20 My name is Bruce Cenicerros, I'm the Project  
21 Manager for the AB 549 Project. Thank you all for  
22 coming today, and thank you for those of you who  
23 are returning after helping us out with some good  
24 input from the first workshop.

25 We definitely used that input, and it

1 was very informative for helping us develop some  
2 of the conclusions and some of the future work  
3 which we have still yet to do. So we're looking  
4 forward to getting some more good feedback from  
5 you today.

6 Please, those of you sitting in the back  
7 seats there, feel free to come up to the table  
8 here. If you have to come and go, don't worry,  
9 we'd rather be able to see the faces and have  
10 better access to the microphones, and encourage  
11 you to chime in when you have some thoughts.

12 As Commissioner Pernell mentioned, this  
13 is the second workshop in a series. And this one  
14 today is focusing primarily on measure and  
15 strategies that may be appropriate for some sort  
16 of regulatory mechanisms, new codes and standards,  
17 or just a requirement that information flow be  
18 facilitate in some way to help private market  
19 transactions do a better job at reducing  
20 efficiency in existing buildings.

21 We will have a third workshop probably  
22 early next year. That will focus on the purely  
23 voluntary kinds of strategies and mechanisms for  
24 improving efficiency in existing buildings. So  
25 while it may seem that we have some kind of

1 predisposition today for the regulatory approach,  
2 please don't get that impression.

3           This is just a small part of the work we  
4 have to do. And I'll explain why we're putting  
5 some more emphasis on this today a little bit  
6 later.

7           Let's see, I'd like to go around and do  
8 some introductions, but first let me get some of  
9 the preliminaries out of the way here. You may  
10 have noticed that the bathrooms across the way  
11 here are not available right now, I think they're  
12 being painted.

13           There are bathrooms back around behind  
14 the security desk and around the corner to the  
15 right there that are also available. Those are  
16 open.

17           If anyone wants to make a comment please  
18 find a microphone if there is not one next to you,  
19 and speak into the microphone. We need to pick up  
20 your voice for the record, and also for those  
21 people who may be listening in on our realtime  
22 audio stream on the Internet.

23           And each time you do have something to  
24 say please state your name and the company or  
25 organization that you work for, for Alan over here

1     who has to make some sense out of everything we  
2     say later on. He'd very much appreciate it, and  
3     we'll probably be reminding you often to do that,  
4     but it would really help us out.

5                 So why don't we go ahead and go around  
6     the room, and state your name and your  
7     organization for us please.

8                 MS. BENNINGFIELD: I'm Lynn Benningfield  
9     with the Heschong Mahone Group.

10                MS. AUSTIN: I'm Cynthia Austin, I'm  
11     also with the Heschong Mahone Group.

12                MS. MODI: I'm Shefali Modi, I'm also  
13     with the Heschong Mahone Group.

14                MR. PIERCE: I'm Tony Pierce with  
15     Southern California Edison.

16                MR. BARDSLEY: Len Bardsley, Southern  
17     California Gas Company.

18                MR. AHMED: Abdullah Ahmed, consultant  
19     to Southern California Gas.

20                MR. HAMILTON: Tom Hamilton with CHEERS.

21                MS. GLASSEL: Bobbi Glassel, I'm an  
22     energy efficiency service company here in  
23     Sacramento.

24                MR. DUDLEY: Paul Dudley, I'm with  
25     Bristolite Skylights.

1 MR. CALABRESE: Dave Calabrese with the  
2 Association of Home Appliance Manufacturers.

3 MS. BACHRACH: Devra Bachrach with the  
4 Natural Resources Defense Council.

5 MR. GUSTAVSON: Dale Gustavson with the  
6 Air Conditioning Contractors of America,  
7 California state chapter.

8 MR. RILEY: Tom Riley with Cogent  
9 Energy.

10 MR. HODGSON: Mike Hodgson with ConSol,  
11 representing the California Building Industry  
12 Association.

13 MR. BROOMHEAD: Cal Broomhead with the  
14 city and county of San Francisco.

15 MR. GARCIA: Al Garcia, I'm Commissioner  
16 Pernell's Advisor.

17 MR. RIEDEL: Randel Riedel, California  
18 Energy Commission.

19 MS. HUSSEY: I'm Elaine Hussey, I'm part  
20 of the AB 549 Team here at the Commission.

21 MS. FABULA: Lisa Fabula with San Diego  
22 Gas & Electric.

23 MS. JENKINS: Nancy Jenkins,  
24 Commission's PIER Program.

25 MR. ALVAREZ: Manuel Alvarez, Southern

1 California Edison.

2 MR. RIEGER: Ted Rieger, Indoor Comfort  
3 News.

4 MR. CENICEROS: Let me try and restate  
5 everyone's names and affiliations, just for the  
6 record here. We've got Elaine Hussey from the  
7 CEC; we have Lisa Fabula from San Diego Gas &  
8 Electric; Nancy Jenkins from the CEC, and Manuel  
9 Alvarez from SGE; and Ted Rieger from Indoor  
10 Comfort News.

11 Great. Thank you all for coming. I'm  
12 going to go through a very brief introduction  
13 here. Let's see. To give you just enough  
14 background so you understand where we are in the  
15 process right now -- again, this is focusing on  
16 mandatory measures.

17 And we talked a little bit about the  
18 purpose of the AB 549 Project here. The  
19 Legislature has asked us for recommendations in  
20 this area, and we plan to supply those probably  
21 around October of 2005 -- a little bit shifted  
22 time schedule due to some challenges in getting  
23 some resources secured in this current budget  
24 environment.

25 I did want to remind everyone, we know

1     there's a whole lot of efforts out there right now  
2     in energy efficiency, focusing on existing  
3     buildings, and they're doing a lot of good things.  
4     We just recognize that there is a lot of potential  
5     left to be examined and achieved in existing  
6     buildings.

7             And so what we're trying to do with the  
8     AB 549 Project is not duplicate or really evaluate  
9     per se any of these existing activities, but just  
10    look for ways to find areas that are currently  
11    outside of the scope of these activities, other  
12    ways of tying things together.

13            We may find that will have new standards  
14    that, like the Title 24 building standards for new  
15    buildings, and also touch on some improvements in  
16    the way of renovations and additions. We may have  
17    some kind of new standards that require certain  
18    things to be done in existing buildings at some  
19    type of trigger event, and we'll get more into  
20    those recommendations today, plus possible  
21    recommendations for new market programs.

22            Maybe things that the PUC should be  
23    doing, areas they're not currently looking at.  
24    Maybe some things that we want to encourage the  
25    private market to do more of, and facilitate

1 things so that they can do those things more  
2 easily, such as building performance contracting.

3 And this just kind of shows where the  
4 work of the Heschong Mahone Group, our consultants  
5 for this project, where their work fits into the  
6 overall project. They are doing for us the things  
7 in blue, characterizing the market -- which they  
8 presented in the first report. That was available  
9 on the table and by e-mail, called Markets and  
10 Potential.

11 And now they are examining the mandatory  
12 strategies that we might consider for existing  
13 buildings. And what we hope to do on a parallel  
14 track was look at the market-based strategies, but  
15 again, because of delays in getting resources,  
16 that's actually going to happen after HMG's work  
17 is completed.

18 Starting early next year we have some  
19 funds that we can now go out with a contract and  
20 secure the skills needed to do that work. That is  
21 a little backwards, I would have preferred to do  
22 the market-based strategies first, look at  
23 everything globally and then pull out the things  
24 that might be most appropriate strategies, but  
25 because of the nature of the funding sources,

1    which is the utilities codes and standards support  
2    funding that funded the HMG contract, we had to do  
3    that first, while all the resources were  
4    available.

5               And so we're going to make this work.  
6    But after we've done both of those tasks we're  
7    going to then develop policy options, always  
8    looking first at the things that make the most  
9    sense from a market-based approach, and then  
10   looking at things that can really augment the  
11   effectiveness of our overall package of  
12   recommendations.

13              That might require some kind of  
14   regulatory assistance or intervention of some  
15   sort. And after that we'll put those  
16   recommendations into the report to the  
17   Legislature.

18              So why are we looking at mandatory  
19   strategies at all? First of all, AB 549, the  
20   language in the bill, makes it very clear that  
21   that was the intention of the bill author and the  
22   Legislature who passed it. And the Governor.

23              California has Title 24 standards that  
24   address new buildings, then they go and say we  
25   need to look at existing buildings. And there are

1 other references in the bill that make it obvious  
2 that we can't ignore regulatory approaches to  
3 improving efficiency.

4 We haven't really looked at all the  
5 possible ways you can do this for existing  
6 buildings, so there are a lot of new areas we can  
7 look at here. And because of California's  
8 aggressive efficiency goals we need to look at all  
9 available means to achieve those goals.

10 Also, as we saw with standards for new  
11 buildings in Title 24, it is a very low cost way  
12 to generate very large savings. All the programs  
13 that are focused on existing buildings right now  
14 usually involve incentive monies and take a lot of  
15 effort, and we're really working customer by  
16 customer, whereas a standard that's well thought  
17 through can achieve a lot of savings without that  
18 kind of investment.

19 And then once the utility programs have  
20 gone through and made improvements in most of the  
21 facilities in California, you've got this, you  
22 know, looking at the adoption curve for any new  
23 technology or measure, you've got what they call  
24 the laggards on the tail end there, that just  
25 about nothing will get those people to move except

1 a standard. So that's one way to address that  
2 group.

3 And also, requirements can provide  
4 information at key times in the life of a  
5 building, such as when a home is sold to the  
6 buyer, or when it's leased to the tenant. It can  
7 allow them to do things that they wouldn't be able  
8 to do without that information. Some times you  
9 need some kind of regulatory fix to make sure that  
10 information's conveyed at that right time.

11 So that's why we're looking at this stuff  
12 today. I want to introduce Cynthia Austin now  
13 with the Heschong Mahone Group. Actually, I'm  
14 going to introduce Tony Pierce next, with Southern  
15 California Edison, and he's going to say a little  
16 bit about the case project, and why they are doing  
17 this stuff. And I'll go ahead and cue up your  
18 presentation, Cynthia.

19 MR. RIEDEL: Bruce, can you manage the  
20 lights?

21 MR. CENICEROS: Oh, yes, sorry about  
22 that. I'll get that after Tony's done.

23 MR. PIERCE: Okay. While Bruce is  
24 bringing that up, I am Tony Pierce with Southern  
25 California Edison, and I get to introduce Cynthia

1 Austin. Bruce already mentioned, but I just  
2 wanted to give everybody a little bit of  
3 background, if you're not aware.

4 The investor-owned utilities have a file  
5 program with the Public Utilities Commission  
6 called the Codes and Standards. The impetus of  
7 the program is to look for codes and standards  
8 enhancements that are cost-effective, and to work  
9 with the Energy Commission and other code-making  
10 bodies to implement those standards.

11 As I said, this is an IOU program. Some  
12 of my colleagues who have already introduced  
13 themselves that are here today are Len Bardsley  
14 with the Gas Company, and Lisa Fabula with San  
15 Diego Gas & Electric, and PG&E couldn't make it  
16 today.

17 Shortly after the bill was signed into  
18 law we started discussions with the Energy  
19 Commission and looking at ways to support this  
20 legislative mandate to the Commission. In 2002,  
21 at the ACEEE Conference, we held a forum and  
22 started to investigate some of the ways that we  
23 could support the Commission.

24 As a result of that forum and other  
25 subsequent meetings, the IOU's accepted a project

1 where we brought HMG in to do some initial  
2 reporting investigations on cost-effective  
3 measures and events for existing building energy  
4 efficiency and peak reduction opportunities.

5 And so what the HMG team is going to  
6 present to us today is the result of the latest  
7 report. So with that, Cynthia, please?

8 MS. AUSTIN: Thank you, Tony. I'm going  
9 to give a short overview, first of all, of the AB  
10 549 support project, and then go into the overview  
11 of the events and measures report.

12 The purpose of the AB 549 support  
13 project is to provide research, analysis, and  
14 recommendations on cost-effective, market-ready  
15 regulatory approaches and strategies.

16 The project is divided into three  
17 reports. The first report markets the potential.  
18 It identified characteristics of the existing  
19 building market so as to identify potential areas  
20 of opportunity for saving energy in existing  
21 buildings. This was made available today in paper  
22 form here at the workshop, and also is on the AB  
23 549 website, handled by the Commission.

24 Today's workshop will be discussing the  
25 events and measures report in detail, and this

1 report provides key events in the life of an  
2 existing building that are opportunities for  
3 energy efficiency improvements, and provides a  
4 list of promising energy efficiency measures and  
5 potential mandatory mechanisms that can be used to  
6 enact those measures.

7 Also listed is the comprehensive  
8 strategies that are suggested for further  
9 research. In November a final report on the  
10 support project will be written, and that will  
11 include the detailed recommendations, along with  
12 savings potentials of those recommendations.

13 Now the first report, markets and  
14 potential, we identified some key major findings.  
15 We found that the majority of the existing  
16 building market is dominated by older buildings  
17 constructed before Title 24 was enacted, resulting  
18 in a wide disparity of energy efficient  
19 construction standards between newly constructed  
20 buildings and existing buildings.

21 Some statistics are that 62 percent of  
22 commercial floor space was built before 1978. And  
23 over 70 percent of single family buildings were  
24 built before 1982. So you can see that there is a  
25 large potential for energy savings that we could

1 do in this market.

2 And because of these potential energy  
3 savings, it justifies further research into the  
4 expansion of authority, potential trigger events,  
5 and other strategies to bring about an improvement  
6 to the existing building stock.

7 Now for the events and measures report  
8 we had to come up with a framework for how to look  
9 at coming up with a list of measures and  
10 strategies. So we decided to try and come up with  
11 the criteria for what would make a successful  
12 regulatory mandate.

13 And using this criteria we formed a way  
14 of how to put measures in context, and I will go  
15 into this in detail in the upcoming slides.

16 In many cases specific measure  
17 requirements are only feasible in the context of a  
18 specific type of event. Typically, when a  
19 component or system is altered or accessed there  
20 is a prime opportunity to consider an upgrade of  
21 related feature.

22 The example I'm showing here is the  
23 installation of a cool roof, cost-effectiveness  
24 would depend on when you're doing the  
25 installation. While it might be cost-effective

1 when you're replacing a roof it might not be as  
2 cost-effective when you're doing a sale of a home.

3 Another thing to consider when you're  
4 coming up with a list of measures is the available  
5 mechanism. In many cases there are already  
6 mechanisms in place that can be utilized to  
7 improve energy efficiency in a building, whether  
8 or not these mechanisms directly deal with energy  
9 efficiency.

10 Obviously the appliance efficiency  
11 standards and the building efficiency standards  
12 are mechanisms that deal directly with energy  
13 efficiency. In other instances regulatory  
14 mechanisms exist, but does not currently address  
15 energy efficiency.

16 For example, in the sales transaction of  
17 building properties, the seller is required by law  
18 to disclose certain information to the buyer, such  
19 as defects in the property, hazards, liens, and  
20 title history.

21 If a seller was required by law to  
22 disclose a building energy efficiency rating at  
23 time of sale, similar disclosure mechanisms could  
24 be utilized. The basic point is that it is  
25 simpler and less costly to leverage an existing

1 process than it is to create a new one.

2 Another thing to keep in consideration  
3 is stakeholder support. Measures must be cost-  
4 effective, market-ready, and have a clear  
5 implementation path in order for stakeholders to  
6 support a mandated change aimed at the existing  
7 building markets. Affected groups must have the  
8 opportunity to air their concerns, and to have  
9 them addressed.

10 For a cost-effective measure or set of  
11 measures to be implemented during a given trigger  
12 event the trigger must be well-defined. We  
13 grouped trigger events into five types. Each  
14 event is defined in more detail in the report, and  
15 I will be discussing a subset of these events  
16 during the measure discussion period this morning.

17 Type one events are triggered by the  
18 recording of a title, or the shift in primary  
19 occupants. This can be seen in the sale of a  
20 building, the lease, rental, or when it's  
21 refinanced.

22 Type two events are triggered by the  
23 requirement of a building permit, as seen in  
24 alterations, additions, equipment or component  
25 replacement, change in occupancy type, or change

1 in status from unconditioned to conditioned space.

2 Type three events are triggered when  
3 building components are accessed, as occurs in a  
4 repair, commissioning a retrocommissioning, or  
5 scheduled maintenance.

6 Type four events are triggered when site  
7 visits to the building are made, as in an  
8 inspection or energy rating, an appraisal, or an  
9 energy efficient mortgage evaluation.

10 And lastly, type five events occur when  
11 meter data is gathered or evaluated, whether when  
12 in participation in a utility program or response  
13 to an inquiry or rate change request.

14 Now a candidate measure or strategy  
15 needs a mechanism where there is a clear and  
16 established authority. The lines of authority for  
17 current mechanisms may need to be re-evaluated in  
18 the context of a specific candidate measure or set  
19 of measures. If the authority is unclear or  
20 lacking, steps must be taken to establish that  
21 authority or find another workable mechanism.

22 In the appliance efficiency standards it  
23 applies to certain appliances manufactured for  
24 sale in California not currently covered under  
25 federal standards. There are currently two

1 rulemaking proceedings underway to update the  
2 appliance standards.

3           Expanding the authorities, where  
4 feasible, of the appliance standards to include  
5 other building components and equipment is  
6 potentially a direct and relatively unobtrusive  
7 way to improve the efficiency in existing  
8 buildings. The mechanism is clean and clear, the  
9 number of units replaced per year determines  
10 market saturation.

11           Within the building standards the CEC  
12 has the authority to establish standards for  
13 building components and systems that are installed  
14 in construction for which a building permit is  
15 required.

16           Updates to the building standards can be  
17 expanded in scope to include more requirements  
18 that apply to alterations in existing buildings.  
19 Examples of this can be seen in the proposed 2005  
20 standards, with duct testing and sealing and  
21 residential windows.

22           Another type of regulatory measurement  
23 is local adopted ordinances. Cities and counties  
24 often have goals for the community that serve as  
25 motivations to reduce local energy use. Local

1 governments represent unique subsets of the state  
2 and are more likely to adopt measurements and  
3 strategies that are more difficult to adopt  
4 statewide, such as in climate dependent measures.

5 local pilot programs help refine  
6 procedures and methods to support a statewide  
7 mandate, and encouraging the adoption of local  
8 efficiency ordinances through technical support  
9 may work best as an initial step prior to the  
10 implementation of statewide mandates.

11 Voluntary mechanisms is another type. I  
12 wanted to mention it here in the beginning even  
13 though it is not in the AB 549 support project  
14 scope, but the point here is that it can be used  
15 as a step for a later statewide mandate. It sets  
16 the stage and helps also for refining procedures  
17 and implementation procedures.

18 In the upcoming morning discussion  
19 period we will be discussing the suggested  
20 measures in the report either that are appropriate  
21 for regulatory mandates-- either in the near-term  
22 or the long-term. We will first review the  
23 potential trigger events that compliment a  
24 regulatory effort and then go into the discussion.

25 In the afternoon discussion period we

1 will explore a set of strategies that we feel have  
2 a strong potential for increasing the energy  
3 efficiency of existing buildings. For the short-  
4 term the strategy consists of utilizing current  
5 mechanisms, and for the long-term the strategy  
6 consist of developing new regulatory mechanisms.

7 And here is the list of the strategies  
8 that we'll be proposing today, and this is also in  
9 your agenda.

10 So Bruce is going to bring up the other  
11 presentation, in which I will give basically a  
12 short introduction of the list of measures that we  
13 have.

14 So this first portion was basically a  
15 short overview of the thought process, of how we  
16 want you to basically look at the measures, and  
17 when you're formulating your responses to think  
18 about all these different contexts. We found that  
19 a lot of things are integrated when you're trying  
20 to formulate a list.

21 And one of the important details to keep  
22 under consideration is when a measure can be  
23 triggered, what type event do you use? Trigger  
24 events under consideration for mandated measures  
25 were chosen because an enforcement mechanism

1 already existed for those events.

2 Specifically, we look at type two events  
3 in which a building permit is required, and a type  
4 one event, such as building sale, refinancing,  
5 lease or rental of a space.

6 The enforcement mechanism of type two  
7 events is a permit process involving application  
8 and inspection. The permit process is familiar  
9 ground with the Title 24 standards, so for the  
10 most part measures considered for this event are  
11 within current CEC authority.

12 Sale of a building already requires a  
13 series of inspections and recording of legal  
14 documents pertinent to a specific property.  
15 Although the CEC does not have current regulatory  
16 authority in this area such permission authority  
17 can be obtained from the Legislature. In cities  
18 and counties measures could be mandated through  
19 local adopted ordinances.

20 Building refinance does not involve an  
21 ownership change, and so provides an opportunity  
22 for a building owner to leverage additional funds  
23 to make energy efficiency improvements. Home  
24 energy rating, or HERS rating, could provide value  
25 in this area.

1           For multi-family or commercial buildings  
2   the sub-lease or rental of a space could provide  
3   the opportunity for mandates in specific cases.  
4   During this event legal documents are typically  
5   exchanged between the owner and the tenant, and  
6   typically inspections are performed to document  
7   the condition of a space before the tenant takes  
8   occupancy.

9           Individual prospective measures were  
10  selected based on performance in utility programs,  
11  statewide incentive programs, program pilots, and  
12  building rating protocols developed by industry  
13  consensus.

14           Now before we begin the discussion  
15  period I want to briefly explain how we're going  
16  to handle the procedure for the discussion.  
17  Handouts of the measure review table -- there  
18  should be three of them -- were made available at  
19  the beginning of the meeting. They look like  
20  this, they kind of list the measures on the right  
21  and the different events are on the top.

22           There are three tables, one for single  
23  family, one for multi-family, and one for  
24  commercial. I will be introducing each sector and  
25  then comments can be given. For each table,

1 measures that could be mandated through a specific  
2 trigger event are listed. Also, keep in mind that  
3 different application scenarios would yield  
4 different savings and cost-effectiveness results.

5           There could be different  
6 conditionalities, or different clauses, of how a  
7 measure could be implemented, and how that would  
8 affect its saving potential.

9           Measures are grouped into six sections.  
10 The first three -- integrated measures, HVAC and  
11 lighting -- will be on one slide, and then the  
12 last three -- building envelope, water heating and  
13 appliances -- will be on the second slide. I  
14 divided them into two slides for better viewing.

15           The tables are intended to spark further  
16 discussion, analysis, and prioritization. We also  
17 only have the morning to discuss this, so please  
18 keep your comments as succinct as possible. Also,  
19 measures that are currently being done in the  
20 standards or for the proposed 2005 standards, are  
21 not considered a candidate measure.

22           Candidate measures are the cons that we  
23 listed with an X in the tables, and we felt -- in  
24 discussion with the IOU team and the CEC staff it  
25 came up as what we felt were good opportunities

1 for savings potential.

2           However, I'm looking forward to hearing  
3 what everyone else would think of what would be a  
4 good measure, what wouldn't be a good measure.

5 If you disagree with where we put our X's I'd like  
6 to hear that too. So why don't we start with the  
7 single family sector.

8           MR. CENICEROS: And you might want to  
9 add one more point of clarification there, because  
10 there's information that we did not include in the  
11 handouts here, just for readability, that is in  
12 the report.

13           There's a comment section that says  
14 "certain measures would only make sense during  
15 certain situations or trigger events," such as  
16 cool roofing material would only make sense to put  
17 on the roof if the roof was being replaced at that  
18 time anyway, is one example.

19           MS. AUSTIN: And for single family we  
20 considered three events which we felt had the most  
21 potential -- alteration, sale and refinance. So  
22 that makes up our three columns for the single  
23 family measure review table.

24           So here is the first portion of the  
25 table, where we have the integrated measures,

1 HVAC, and lighting measures. So if anyone would  
2 like to make comments at this time?

3 MR. BROOMHEAD: I have a couple. Cal  
4 Broomhead, city of San Francisco. A couple of  
5 questions. One is, are you assuming in this,  
6 before we take a close look at it, that single  
7 family homes are owned? Because we have a large  
8 number of single family homes that are actually  
9 rented in San Francisco.

10 MS. AUSTIN: Yes. And actually, if you  
11 look at the markets and potential report, you  
12 know, we take that into a fact, but we've found at  
13 least that the opportunity for causing improvement  
14 were more common in these three events.

15 Yo can do it for all the types of events  
16 that we had, but to limit -- you can see that we  
17 have such a number of measures, and to look at the  
18 12, 15 different events that we considered we  
19 decided to, let's look at the best three.

20 MR. BROOMHEAD: And then for housing  
21 units that are two to four units in a building,  
22 are you considering them single family or multi-  
23 family?

24 MS. AUSTIN: I think we're -- we have a  
25 multi-family table, and I think that would be

1 better suited for the multi-family table.

2 MR. BROOMHEAD: Okay, that's fine.

3 Thank you.

4 COMMISSIONER PERNELL: Commissioner  
5 Pernell. On your integrated measures, are you  
6 suggesting that a HERS rater inspects a property  
7 twice? Is that why we've got -- you've got HERS  
8 rating, and then you've got HERS rating in  
9 building upgrades, so --?

10 MS. AUSTIN: We'll either have a HERS  
11 rating done, and then the second one is when you  
12 actually make improvements based on the HERS  
13 rating.

14 MR. CENICEROS: So one is just  
15 evaluating opportunities, and the other one adds  
16 to the evaluation the actual implementation of  
17 some of the recommendations.

18 COMMISSIONER PERNELL: All right. And  
19 have you considered the cost of that, to have the  
20 HERS rating done twice?

21 MS. AUSTIN: Well, it's not coming up  
22 twice. It's more -- a different type of measure.  
23 So you can either have the HERS rater come, and  
24 you can, you know, decide to do their recommended  
25 improvements.

1           MR. BROOMHEAD: So you could decide  
2   that, once a HERS rating is achieved, then that  
3   particular structure doesn't have to file a  
4   certificate for the next ten years or something  
5   before HERS would then be required again?

6           MS. AUSTIN: That's one of the ideas.

7           MR. BROOMHEAD: And you could figure out  
8   what that time frame was.

9           MR. CENICEROS: And it should also be  
10  noted that some of these things might ultimately  
11  be required only for certain types of homes, say  
12  of a certain age or ones that don't have certain  
13  things already done to them, like insulation in  
14  the walls or too little in the ceiling.

15           There are a lot of caveats that you  
16  could put on, and then these requirements might  
17  make sense to do. And we're not looking at all  
18  those caveats here, we're just looking at whether  
19  the measure, in some instances, might make sense.

20           MR. HODGSON: Mike Hodgson, CBIA. In  
21  order to kind of prioritize which measures seem to  
22  have a bigger impact, just glancing at your market  
23  potential, is there a description of what impact,  
24  if we do these savings, would have on the  
25  marketplace? I see that there are a number of

1 units, and a pie chart breakdown.

2 But if you take the number of units and  
3 put R30 ceiling installation, do yo save, you  
4 know, 400,000 KW? I don't know, is there that  
5 kind of analysis so we could weight which items  
6 would be more cost-effective to do?

7 MS. AUSTIN: Well, that's actually what  
8 we were hoping to hear at the workshop, a savings  
9 potential portion of the AB 549 support project is  
10 supposed to come after the workshop, based on what  
11 we're hearing from the participants today.

12 MR. HODGSON: Okay. But how do we make  
13 reasonable choices if we don't know what potential  
14 is there, based on what you found the market to  
15 look like?

16 MS. AUSTIN: Well, in the markets and  
17 potential report we do have, based on different  
18 end uses, we signed a report done by Kema Xenergy  
19 for Pacific Gas & Electric, that looks at the  
20 potential in the residential and the commercial  
21 sector, of what the potential could be for the  
22 upcoming years.

23 And obviously lighting and heating,  
24 lighting in residential was the top end use,  
25 heating was the best for demand reduction.

1           The commercial sector I think is --  
2    okay.

3           MS. BENNINGFIELD:  Mike, I think maybe  
4    we should back up here and say what we're trying  
5    to do here is put everything on the table.  We  
6    don't know what flavor or color it's going to be  
7    necessarily yet, but we want to make sure we have  
8    the bases identified.

9           And we're going to use this saturation  
10   data once we get a specific measure defined.  For  
11   example, is the HERS going to be just information  
12   only?  If so, it probably won't save any energy.  
13   If it's have the rating and install X, Y, Z  
14   measures, if they're not present, then we can  
15   quantify that energy savings based on vintage of  
16   home and so on and project it out statewide.

17          So this process isn't really necessarily  
18   to rank from, although we would like people's  
19   opinions about feasibility, you know, likely  
20   savings.  And if you can give us some more  
21   information about under what conditions they'd be  
22   more cost-effective than others, you know, then  
23   we'll take that into consideration too, so --.  Is  
24   that --?

25          MR. CENICEROS:  Yes, this is really just

1 a first filter. If we looked at all the measures  
2 on these tables we couldn't really realistically  
3 do cost-effective analyses for all of them. What  
4 we're trying to do is filter down the ones that  
5 seem to have most potential, based on everyone's  
6 gut feeling or experience in the field, or that  
7 are what Cynthia referred to.

8 And then, with that smaller list, we'll  
9 go in and look at cost-effectiveness in the next  
10 step.

11 MR. HODGSON: Yes, and I'm not trying to  
12 look at cost-effectiveness, I'm just trying to  
13 figure out where is the potential savings. And is  
14 it within the scope of your work to figure out  
15 where that is, so that we can be directed?

16 You know, should we insulate all the  
17 windows, should we insulate the ceiling, or, you  
18 know, that's kind of what I was looking for was  
19 some guidance as to say, and then try to figure  
20 out how to get there. But I was just wondering --  
21 and the status of existing housing site.

22 COMMISSIONER ROSENFELD: This is Art  
23 Rosenfeld. I'm sort of with Mike, I see a close  
24 connection between conservation supply curves from  
25 PG&E -- which you mentioned, Cynthia -- and this.

1           Now of course the supply curves have  
2 both, the X axis is energy, and the Y answer is  
3 the cost of conserving energy, so both are  
4 addressed. And I have those books on my desk, but  
5 that doesn't mean I remember all the categories.

6           They do in fact look at retrofit as a  
7 set of measures, right? So one can look at either  
8 the summary document, which is the energy  
9 foundation document called The Secret Surplus, or  
10 the PG&E documents.

11           And they have, I don't know, they have  
12 270 measures, of which I think half are retrofit.  
13 And they do give the potential, and they do give  
14 the cost to conserve energy. So I guess you folks  
15 are going to pour over that document a lot, huh?

16           MS. BENNINGFIELD: Yes. If it's the  
17 same report I'm thinking of it's more global in  
18 nature. It says the potential is X gigawatts and,  
19 you know, here's our laundry list of things that  
20 includes.

21           But it doesn't say -- and it applies to  
22 this particular vintage of homes and this  
23 particular climate zone -- does it give that  
24 detailed level of data?

25           COMMISSIONER ROSENFELD: Yes, I mean the

1 totals are made by something over individual  
2 thousands of instances.

3 MR. GARCIA: Art, this is Al Garcia. I  
4 think that information is contained in the, it  
5 used to be called the Residential Appliance  
6 Saturation Survey, and it breaks down the  
7 appliance saturation, and then they've  
8 extrapolated from that, and I think that's the  
9 report you're talking about?

10 COMMISSIONER ROSENFELD: That's right.  
11 These reports start with the saturation surveys,  
12 and then they calculate the cost of conserved  
13 energy and eligibility for access and stuff like  
14 that.

15 MR. GARCIA: Yes, exactly.

16 COMMISSIONER ROSENFELD: And so it's  
17 pretty thick. But they're on the PG&E website.  
18 And the summary document is on the Energy  
19 Foundation website.

20 MR. HODGSON: I'd appreciate your  
21 assistance, Art, in finding that. It sounds like  
22 a useful document.

23 COMMISSIONER ROSENFELD: Lunchtime.

24 MR. HODGSON: Thank you.

25 MR. BROOMHEAD: Mike, it's also on the

1 Cal Mac website.

2 MS. BENNINGFIELD: We could probably put  
3 those up as reference documents. Maybe on the 549  
4 site as well?

5 MR. CENICEROS: Yes, I think so. I also  
6 want to point out that there's a lot of background  
7 in the markets and potential report, which is also  
8 the information I was presented at the last  
9 workshop in July that gave us a lot of direction  
10 in terms of where to focus in terms of measures,  
11 as well as types of housing which trigger events  
12 also. So we have information to get to where we  
13 are right now.

14 MR. GARCIA: Bruce? Is the Xenergy  
15 report on there too?

16 MR. CENICEROS: It's not on our website.  
17 It's in our references.

18 MR. GARCIA: Maybe you ought to put a  
19 link on there?

20 MS. BENNINGFIELD: Yes, that's in our  
21 list of reference documents to look at. I think  
22 that the potential that's quantified in those  
23 reports is, you know, if everything were upgraded,  
24 and what we're looking at is the first baby step.  
25 Where do we start and what do we require and under

1     what conditions do we require them?

2                   And so we've got this big potential  
3     balloon out there, where do we start in terms of  
4     the regulatory process to kind of chip away at it  
5     and make it fully realized.

6                   COMMISSIONER PERNELL:   Commissioner  
7     Pernell.  Let me just ask a question in terms of  
8     -- and I know we're right at the beginning of  
9     this, but the reports that were mentioned, are  
10    those going to be, somewhere down the line,  
11    incorporated, so that -- and I would agree with  
12    Mike -- so that the more cost-effective realistic  
13    decision on the measures can be made?

14                   And to say we've got these reports out  
15    here and you can get them here and there and all  
16    of that, I'm just wondering whether or not, is  
17    that something that the consultant team is going  
18    to bring together to be able to have the  
19    stakeholders, you know, do a better  
20    recommendation.

21                   Because if you, you know, I've heard  
22    three different reports.  Most of them are on  
23    Art's desk -- so I'm just, it's more of a  
24    recommendation I guess to followup on what Mike  
25    was saying, is that at some point we have to get

1 on with the data, put it together, and come out  
2 with something that -- or at least some  
3 recommendations -- that would, I would think would  
4 say "if you use this set of measures, you're going  
5 to save this much energy."

6 And I think, at the end of the day --  
7 and we don't have to do this now -- but I think at  
8 the end of the day that's the type of report that  
9 legislators would want to look at. Because  
10 they're not going to read no big stack of four or  
11 five different reports.

12 MR. PIERCE: Tony Pierce with SCE. The  
13 last task of the IOU project that HMG is working  
14 on is to do just what we're describing here. When  
15 we constructed the work scope the feeling was that  
16 we needed to work with staff and have these  
17 workshops and solicit input from stakeholders on  
18 which measures that we, as a consensus, felt were  
19 viable in the current build environment.

20 And then look at the potential, both  
21 energy and demand savings, of those measures as  
22 the last task. So the questions are greater, and  
23 that task is part of the work project, and we'll  
24 be working to complete that in the next 30 to 45  
25 days, on the measures that basically come out of

1     this workshop.

2                   MS. BENNINGFIELD:   And if I can direct  
3     everyone, this is Lynn Benningfield, to this  
4     markets and potential report.   If you turn to page  
5     19 that is where we graphically show the savings  
6     potential by end use in the residential sector.  
7     And this is taken directly from the report that  
8     you referenced.

9                   So for example, in air conditioning  
10    energy, the potential is shown there on the bar  
11    graph.   And the two graphs are technical versus  
12    economic potential.   But these have a lot of  
13    assumptions and presumptions behind them, and what  
14    we're trying to do is craft something that might  
15    be implementable in the near term and save, you  
16    know, somewhat of a fraction of this.

17                  So this will be the pie that we'll be  
18    looking at, and things that come out of this  
19    process we'll be assigning savings to them, so  
20    there will be some subset of this.

21                  COMMISSIONER ROSENFELD:   But, one last  
22    comment.   This is 80 percent, getting it written  
23    down.   On the other hand, if you look on page 19,  
24    you see that the potential for lighting is huge,  
25    and the potential for water heating isn't so big.

1           But it may be that wrapping a water  
2 heater is very, very cheap, and very effective,  
3 and that the lighting itself is harder to do. So  
4 the point about the reports that we keep  
5 discussing, and I will bring them in after lunch,  
6 is that they also give a cost per conserved  
7 kilowatt hour, or per conserved therm, and we need  
8 to bear that in mind.

9           MS. BENNINGFIELD: Okay, great.

10          MR. AHMED: I want to make a comment,  
11 A.Y. Ahmed, consultant to Southern California Gas.  
12 I just wanted to point out that, in the market  
13 potential analysis we should consider two things.

14          One, the longer changeouts that have  
15 been occurring in the market by the homeowners;  
16 and number two is the utility sponsored programs.  
17 The utilities have almost 50 years of conservation  
18 in the existing market, and they have been doing  
19 this, and we need to know what has been achieved  
20 and what kind of measures the utilities have  
21 successfully implemented.

22          And that should also include the low  
23 income programs, those are the most energy  
24 consuming homes. And we need to at least subtract  
25 that out from the market potential and consider

1     that.  I hope that's going to be done.

2                 MR. HAMILTON:  Tom Hamilton with CHEERS.

3     My question may indicate my lack of knowledge in  
4     this, but I would counsel that determining cost-  
5     effectiveness of the measures is less important  
6     than how do the measures get installed?  It's  
7     fairly easy to determine that, if a house that has  
8     no attic insulation in Fresno, and you put in R38,  
9     it's going to save X amount of energy.

10                There's been, you know, thousands of  
11     studies, all the 2005 building standards work  
12     that's being done.  But the real issue is how do  
13     you get the insulation in the attic, and what does  
14     it take to get it in the attic?  Is it, you know,  
15     working with realtors, home inspectors,  
16     appraisers, whatever?

17                I think that's more important than  
18     focusing -- certainly knowing what measures, but  
19     it's also, I don't think you want to dovetail or  
20     tie in specific measures to a particular home.

21                I think the goal would be, instead of  
22     saying "here are the five things that should be  
23     installed" it should be "here's how much we think  
24     should be saved", 30 percent or 50 percent,  
25     whatever it takes to get to that 50 percent

1 savings is a good thing, and here's a list of  
2 recommended measures that could do that.

3 I would like to see more -- and I think  
4 you've covered some of it -- how do we get it to  
5 where we can get the measures installed?

6 MR. CENICEROS: Okay, thanks, Tom. Any  
7 other questions on other tables before we move  
8 into --? Okay, Dale.

9 MR. GUSTAVSON: Dale Gustavson, Cal-  
10 ACCA. On the table, the table itself for single  
11 family measures, not very far down the page is  
12 refrigerant charge and air flow emission rates.  
13 And I would like to suggest that, in light of the  
14 fact that the technology already exists in the  
15 marketplace, that we might want to add capacity  
16 measurement and efficiency measurement, or  
17 capacity and efficiency index.

18 There are different -- or, wrap all of  
19 them into something called advanced portable  
20 diagnostics. And then define that a little more  
21 clearly as a subset. But refrigerant charge and  
22 air flow measurement is sort of the tip of the  
23 technical iceberg right now, in terms of what's  
24 available.

25 MS. BENNINGFIELD: Okay, thank you.

1 MS. BACHRACH: Devra Bachrach with NRDC.  
2 I'm interested to hear a little bit more about  
3 whether you considered the point of utility hookup  
4 as a trigger event. It's not included on these  
5 three, and by hookup I mean when the new homeowner  
6 or the new renter calls the utility to set up  
7 their account.

8 MS. BENNINGFIELD: We do have that  
9 identified as a trigger, and we felt it was better  
10 aligned with the voluntary event. Although it is  
11 conceivable that a utility could require something  
12 be installed in order to receive a new meter.  
13 This is something that's going to take some  
14 voluntary action before it becomes feasible as a  
15 mandate.

16 Do we have any other comment on the  
17 single family?

18 MS. AUSTIN: Should I move on then?  
19 This is the last three sections in the single  
20 family table -- building envelope, water heating,  
21 and appliances.

22 MR. CALABRESE: Dave Calabrese with  
23 AHAM. I just wanted a point of clarification, I  
24 may have missed this, but when there isn't an X in  
25 the box and I'm interested in a refrigerator on

1 down, what is the status of those measures then?

2 MS. AUSTIN: I believe it's because the  
3 federal standards probably will take more effect  
4 in those cases, so we didn't want to have to deal  
5 with any preemption issues, and that's why it  
6 doesn't currently have an X. And I think that's  
7 listed in our report, under the conditionality  
8 clauses.

9 MS. BENNINGFIELD: And I might add that  
10 also it's strictly not cost-effective to require a  
11 replacement of a refrigerator at the time of sale,  
12 so we wanted to list every measure that was  
13 popular, and we only have the X's on the ones that  
14 we consider to be feasible.

15 If there's anybody who has interest in  
16 adding additional X's, we'll put them on the plate  
17 again. But refrigerators dropped out quite  
18 quickly at that trigger. It's interesting to note  
19 that the group is kind of going through the same  
20 thing we went through.

21 There's things that are cost-effective  
22 to do in all cases, there's things that are cost-  
23 effective to do only in certain areas or only at  
24 certain times or only if certain mechanisms are in  
25 place. Only if certain diagnostics are available.

1 So a lot of these are very conditional, so it's  
2 difficult to put them up there like this without a  
3 lot of qualifying.

4 But I think it's a good way of starting.  
5 It's sort of the last opportunity for you to give  
6 us some input on specific measures you'd like to  
7 see. In the afternoon we'll be talking about a  
8 little more integrated strategies.

9 MR. BROOMHEAD: Cal Broomhead. I wanted  
10 to ask, refrigerators are not cost-effective?  
11 What were the assumptions --?

12 MS. BENNINGFIELD: If a working new  
13 refrigerator is present at the single family house  
14 at the time of sale, yes it's not.

15 MR. BROOMHEAD: A working new  
16 refrigerator. Then if it's one that's ten years or  
17 older, then --?

18 MS. BENNINGFIELD: Right. If there's  
19 one ten or 15 years old, our thinking is it's  
20 likely to be replaced in a certain period of time  
21 anyway, so you don't necessarily need a trigger of  
22 a sale of a home to capture those last couple of  
23 years.

24 it might not be worth the effort of  
25 going through the regulatory hurdles just to

1 capture that last bit of savings. Maybe the  
2 homeowner might do it on their own anyway for  
3 various reasons, or maybe it will end up being  
4 replaced through a utility program, or maybe it  
5 will just die and need to be replaced at some  
6 point.

7 MR. BROOMHEAD: Okay.

8 MR. HODGSON: Cynthia, a clarification  
9 again on the X's. I'm not sure what's cost-  
10 effective and what's -- I mean, I think we're just  
11 trying to identify opportunity, right? I mean, if  
12 the X is in the box then that's an opportunity  
13 that we should explore. That's the intent here?

14 MS. AUSTIN: Yes.

15 MR. HODGSON: Then I would like to back  
16 up, because I think there should be some X's on  
17 alterations. if you do an alteration you should  
18 look at the duct insulation, which is on the first  
19 three groups. I'd add an X there.

20 If you're doing an alteration you should  
21 also should look, I think, at the window U Factor,  
22 and the window solar heating coefficient.

23 MS. BENNINGFIELD: Mike, are you talking  
24 about the HVAC alteration, or any kind of  
25 alteration?

1           MR. HODGSON: Any kind. Alteration I  
2 presume meaning getting a building permit?

3           MS. BENNINGFIELD: Yes. So if you're  
4 going to get a building permit to replace a window  
5 you should look at your duct system at the same  
6 time, that's what you're advocating?

7           MR. HODGSON: Well, no, I presume the  
8 alteration would be specific to what the  
9 alteration is. So if you're going in and  
10 replacing your mechanical system, and you have a  
11 permit, then you should look at your duct  
12 insulation. That's how I'm interpreting this.

13           If you're, let's say, moving a wall out  
14 three feet, and you have to put new windows in,  
15 but you're not messing with the HVAC system, then  
16 you leave that alone. But, you know, you put in  
17 .4 window U value, .4 solar heating coefficient,  
18 something like that. Is that, am I in the right  
19 ballpark?

20           MS. BENNINGFIELD: Yes, but the reason  
21 there's no X's there for those kinds of  
22 circumstances is because in the 2005 standards  
23 those are addressed. So when you replace a HVAC  
24 unit in the 2005 standards you will have to do the  
25 duct ceiling. And the same thing with the

1 windows. You're going to have to meet the  
2 prescriptive requirements for new windows.

3 But if there's other alterations that  
4 aren't going to be affected by the 2005 standards  
5 that have opportunities, definitely we need to put  
6 X's in those.

7 MR. HODGSON: Okay, then maybe you could  
8 explain the time frame for what this is doing. I  
9 mean, are we doing something now that will take  
10 effect in 2006, or are we trying to do something  
11 now that will have an impact on the marketplace  
12 sooner than that?

13 And it sounds like the direction you're  
14 taking -- you meaning staff -- in this process is  
15 strictly regulatory, which, whenever there's an  
16 open comment period I'd like to add some comments  
17 on. I perceive Tom will have some comments on it.

18 Because the building industry would very  
19 much like to have a working HERS system in the  
20 existing market, and this doesn't address that. I  
21 mean, that's a voluntary system, so when we get to  
22 that section I'd like to open that up.

23 So this is a regulation that you're  
24 proposing, if we did a regulation it couldn't be  
25 any sooner than 2006, so that means that anything

1 in the 2005 standards would supersede this. Is  
2 that the -- okay?

3 MR. CENICEROS: That's right. I would  
4 also add that the building and appliance standards  
5 setting process, as well as -- for both building  
6 standards and appliance standards -- anything that  
7 can be handled within the current processes with  
8 no change in authority for the Energy Commission  
9 over those processes, we consider to better happen  
10 within those existing processes, and we don't need  
11 to make any recommendations to the Legislature as  
12 part of AB 549, although there are specific things  
13 that may be more difficult to do in those  
14 processes.

15 We might have supporting languages or  
16 something in there, but that's not the main  
17 purpose of AB 549. And the time frame is such  
18 that we really won't expect any results from the  
19 Legislature probably until 2006 or later.

20 This information will go into a report  
21 to the Legislature in October of 2005, and  
22 hopefully it will be addressed in the 2006  
23 session.

24 I should also point out, though, that we  
25 are going to be providing an interim report by the

1 first of the year 2004, and if you see  
2 opportunities that we should make the Legislature  
3 aware of right now, things they can act upon  
4 during 2004, we're willing to consider that, too.  
5 It's an opportunity to do that.

6 COMMISSIONER ROSENFELD: This is Art  
7 Rosenfeld again. Let me see if I understand what  
8 Mike is bringing up. Under the alteration column  
9 you have rather few X's. But inclusive in every  
10 blank here -- let's look at HVAC, is really  
11 another symbol, call it a star if you want.

12 Which means, if you get a permit to  
13 upgrade the HVAC system then you have to upgrade  
14 all parts of the HVAC system, which are in the  
15 current building standards. Now, of course the  
16 '06 standards, Mike, won't take place until '06.  
17 But if there's something in the present standards  
18 you would have to bring it up to do that.

19 MR. HODGSON: Right. but Commissioner  
20 Rosenfeld, that's a really interesting issue, and  
21 I have no means to represent the building  
22 officials here, but there is a huge discussion  
23 between the authority of the Energy Commission and  
24 the authority of HCD on existing buildings.

25 And we've asked twice that during the

1 2005 standards that that be clarified. My  
2 understanding is it still has yet to be. And  
3 unfortunately Commissioner Pernell has left the  
4 room, because he is leading that charge.

5 So that whole column of alterations is  
6 really kind of I guess up in the air in discussion  
7 as to what the CEC has authority to do, and what  
8 it does not.

9 I'd love for that to be clarified. It's  
10 not our issue, it's really between the two state  
11 agencies. But assuming you have the authority to  
12 go into the existing building then that  
13 alteration, you know, column opens up to all sorts  
14 of opportunity for you.

15 MR. GARCIA: Okay. Al Garcia here.  
16 I've got a comment, and I actually wanted to go  
17 back to something that Rebecca and Cal had talked  
18 about. And Rebecca earlier mentioned a trigger  
19 event being the hookup into the utility system,  
20 and Cal had mentioned the multi-family and the  
21 single family home renters in San Francisco.

22 And I'm going to urge the group to take  
23 another look at the trigger events. It seems to  
24 me that by not including something like hooking up  
25 to the utility system you wind up not including a

1 pretty significant portion of the residential  
2 population, which is something like anywhere  
3 between 12 and 20 percent.

4 Because I don't really see a whole lot  
5 of events here that would wind up sweeping these  
6 folks, or these dwellings, into the process. So I  
7 think you need to rethink that a little bit.

8 MR. CENICEROS: And Al, do you think  
9 that by our considering that as more of a  
10 voluntary mechanism, kind of a trigger event, that  
11 that will lose that opportunity? Or do you think  
12 we definitely should look at regulatory options?

13 MR. GARCIA: The answer to that is I  
14 think we can look back on historical performance,  
15 and we know that voluntary participation doesn't  
16 get the kind of market penetration as regulatory.  
17 I mean, that's why you're considering this very  
18 set of actions.

19 MR. BROOMHEAD: Cal Broomhead. If I can  
20 add to that, the residential energy conservation  
21 ordinance in San Francisco passed because of the  
22 split incentive issue. That's why it got the  
23 political support to become instituted.

24 And that's why they also passed a  
25 commercial energy conservation ordinance in the

1 late 1980's, which was eventually repealed for  
2 other reasons that I'll talk about when we get to  
3 that area, but it's the whole problem of the split  
4 incentive, when you require the building to do  
5 something when the tenant really doesn't have the  
6 capacity to be able to do.

7 But I was going to ask, if you have some  
8 of these measures that you think are addressed by  
9 the 2005 Title 24 adoption, what are the other  
10 ones that didn't get included. I mean, can you  
11 just quickly run down this list and kind of tick  
12 them off, as to which ones those are?

13 MS. BENNINGFIELD: At the authorization  
14 trigger event? Because standards address  
15 alterations, and --

16 MR. BROOMHEAD: But I'm just saying,  
17 rather than us just asking questions and then  
18 finding out that a particular one is either -- are  
19 those the only two, or is that the only one, the  
20 duct insulation -- and you mentioned windows?

21 MS. AUSTIN: I would also, when you're  
22 looking at these tables, maybe take a glance at  
23 what the other tables are in our report, because  
24 in some other conditional clauses we say that.

25 MR. BROOMHEAD: You say that, okay.

1           MR. CENICEROS: I think if you'll look  
2 at pages -- this is the events and measures  
3 report, pages 22, 23, and 24 -- and you'll see the  
4 comments column does cull out many of the  
5 instances at least where they are covered into the  
6 existing standards.

7           MR. BROOMHEAD: Okay, well, I'll go back  
8 and read that.

9           MS. BENNINGFIELD: What I do see now,  
10 though, is increased efficiency of hardware  
11 lighting systems. That would be covered under  
12 residential alterations, which it does apply to.

13          MR. BROOMHEAD: Okay. Well, I was going  
14 to ask about programmable setback thermostats.  
15 It's already covered under the alteration  
16 requirements in the page 22 notes, but it seems  
17 like a really good opportunity at time of sale.  
18 It's such a cheap, easy thing to do, and could be  
19 there.

20          MS. BENNINGFIELD: Good idea.

21          MR. HODGSON: Cal, just for  
22 clarification -- Lynn, I'm not sure, is lighting  
23 covered in the retrofit in kitchens?

24          MS. BENNINGFIELD: Yes, I think there's  
25 an exception, there's a threshold. If you're

1 replacing more than so many watts in the kitchen  
2 you do have to meet it. I can't recall off the  
3 top of my head what the --

4 MR. HODGSON: Yes, I'm unfamiliar with  
5 that section, but Cal, the only other two things I  
6 know would be covered on the retrofit side would  
7 be windows and duct insulation, if you replace the  
8 condenser. So if you --

9 MR. BROOMHEAD: Okay, and since we have  
10 no residential air conditioning in San  
11 Francisco, --

12 MR. HODGSON: I just want to tell you  
13 that's what's in the standards proposed in 2005.  
14 It doesn't affect water heating. We've got Mr.  
15 2005 to my right and -- Bill, is there anything  
16 else in the 2005 standards in retrofit?

17 MR. CENICEROS: Things that are required  
18 by --

19 MR. PENNINGTON: Well, the residential  
20 lighting requirement is --

21 MR. CENICEROS: This is Bill Pennington  
22 of the CEC, sorry.

23 MR. PENNINGTON: The authorization  
24 requirement for residential lighting applies --  
25 I'm trying to think here -- there was an exception

1     that we had to create, and it's not coming to  
2     mind. But in general we're trying to make it  
3     apply to kitchen alterations.

4             MR. HODGSON: Just to kitchens, though?

5             MR. PENNINGTON: Well, actually all of  
6     them. If you're just changing one luminaire then  
7     it's pretty easy to have that luminaire comply.  
8     In kitchens there's a percent of the total watts  
9     that's covered in the standard, and so if you're  
10    doing a portion of the kitchen, then you have a  
11    hard time figuring out how to do that.

12            So, actually I'm forgetting exactly what  
13    the terms were for the exceptions.

14            MR. HODGSON: Well, if it's similar to  
15    what it is for new construction, then if you start  
16    changing out a couple of incandescent fixtures  
17    then it will trigger the entire kitchen to be  
18    fluorescent or high efficacy lights.

19            But I just want Cal to be clear, the  
20    retrofit portion of the 2005 standards is fairly  
21    nominal. It's not this big shopping list, it's  
22    just a few things, that's all.

23            MS. BENNINGFIELD: Yes, Tom?

24            MR. HAMILTON: I'm sorry, Tom Hamilton.  
25    On the table again, the three trigger events.

1     What's the difference -- well, I understand what  
2     the difference is between a sale and a refinance,  
3     but as an example, down in the building envelope,  
4     roof/attic insulation has an X for sale, why  
5     wouldn't it have an X for when you refi, because  
6     you still, the sale, there still is a change of  
7     title- - or not a change of title, but a  
8     rerecording of title, and you still have to go  
9     through the same process.

10            You can't make any improvements to the  
11     home until you own it, so you still didn't have to  
12     hire a contractor. So I would think, in many  
13     cases, if somebody is refinancing, you go through  
14     the same process that you do when you buy a house,  
15     to a certain extent.

16            In many cases refinance may have an  
17     opportunity similar to what you have in sale.  
18     That may not be the case across the board, but  
19     just --.

20            MS. JENKINS: Nancy Jenkins with the  
21     Energy Commission. I'm wondering if, on the  
22     blanks, if it would be helpful -- I'm wondering  
23     about the next generation of these tables if you  
24     could actually include some additional symbols  
25     that might help us understand whether or not you

1 found them not to go through the first screening  
2 because they're covered through the 2005  
3 standards, or whether it's through federal  
4 preemption standards, or whether cost-  
5 effectiveness is the issue.

6 I mean, obviously, you've given this a  
7 lot of thought, so it would help us to, you know,  
8 be able to quickly understand why it is that you  
9 thought that those didn't fit.

10 MS. BENNINGFIELD: Okay, we'll include  
11 those clarifications on the final report. Seeing  
12 as how it's 11:20, and we have a few more tables  
13 to get through and other occupancies, should we  
14 move on? We'll have other opportunities to  
15 address single family alterations and more  
16 comprehensive strategies on single family  
17 residences this afternoon.

18 MR. CENICEROS: We also, we're loosely  
19 formatted here, so you could fill in your own X's,  
20 or cross out some of the ones we already have, and  
21 write comments in the margin area, or give us  
22 other input on these forms, and hand it in to us  
23 so we can take that away with us, whatever we  
24 didn't have time to say now, or you think of  
25 later. So please feel free to do that.

1 MS. BENNINGFIELD: Okay, do yo want to  
2 --? Okay, go ahead.

3 MS. AUSTIN: Oh, and you can also add  
4 others that are not currently on the list. For  
5 the multifamily trigger event we have slightly  
6 different events that we have chosen. We have  
7 alteration, we have sale and refinance -- we kind  
8 of grouped those together. And also an obvious  
9 trigger event is rental of space, when the  
10 occupants change.

11 So if you want to take out your multi-  
12 family trigger event measuring table. Basically  
13 the same process, and if anyone -- I'll give you a  
14 moment to renew it, and if anyone has anything to  
15 add or comment on at this time on multi-family?

16 MR. BARDSLEY: Yes, Len Bardsley, SoCal  
17 Gas. Under rental column, how would you go about  
18 tracking that if this was a mandatory measure?  
19 With regards to, many rentals are very informally  
20 done?

21 MS. BENNINGFIELD: That's a good  
22 question. We don't exactly know how it would  
23 happen, what the enforcement mechanism would be  
24 yet. We do know that these are very easy  
25 installs, very cost-effective, initially

1 relatively low-cost, not too many accessibility  
2 issues.

3 In terms of how they would prove they  
4 met a mandate, that would be something we'd have  
5 to work out, in terms of the mechanism.

6 MR. GARCIA: Al Garcia here. Lynn, I  
7 think you actually, one of you guys actually  
8 provided the answer when you were talking about  
9 how you selected the trigger events.

10 And I think one of the things you said  
11 was, gosh, you know, there should be an existing  
12 enforcing, something of an underlying  
13 infrastructure and maybe an enforcing structure.  
14 And tha's getting back to the comment that I made  
15 earlier, you know, hooking up to the utility is  
16 the trigger. And it's also the enforcing  
17 mechanism.

18 MS. BENNINGFIELD: Thank you. So, yes,  
19 there aren't any rental change of occupancies  
20 where there is not a change of an account, are  
21 there?

22 MR. HODGSON: Seems like an awful  
23 extreme measure, not that I'm against it, of  
24 course. We'd like to do these things to the  
25 retrofit market. But normally, in course of

1 business when you rent something you typically  
2 call up the utility, they ask you for some type of  
3 credit application, that all happens within the  
4 last 24 hours of when you actually move into the  
5 system.

6           You then go and -- and the utility now  
7 is the bad guy, because they're going to turn off  
8 your electricity and gas. You're going to call  
9 them up and go "how come?" And then they'll go  
10 "well, you didn't put ceiling insulation in." And  
11 you'll go "what are you talking about?"

12           And then you're going to have to --  
13 assuming this person is voluntarily doing this,  
14 they're going to go get a contractor. "Well, in  
15 three weeks we can install your ceiling  
16 insulation." So don't refrigerate, don't heat.

17           I think you're, you know, I think the  
18 rental issue and even a refinance issue is an  
19 interesting trigger, but not a realistic one. I  
20 think at time of sale, where there is notice and  
21 there's a more formal process, that is issue one.

22           But you may have the attention of the  
23 builder at the time of construction to get a, you  
24 know, a meter. That's fine, we have that process  
25 in place. But once that meter is there, and

1     you're going to go from one transition to another,  
2     which is very fluid, very liquid, very quick in  
3     the rental market -- and I agree with you, a lot  
4     of rentals are done informally -- then now the  
5     enforcement agency is the utility, and I'm sure  
6     they're very excited about that opportunity to  
7     meet the customers in such a positive manner.

8             But I don't think realistically that's  
9     something that -- I mean, we should write it down  
10    and we should consider it, but I don't really  
11    think it's a popular one or realistic one in the  
12    market.

13            MS. BENNINGFIELD: I'd like to hear from  
14    Cal, do you have any insight as to what's been  
15    tried?

16            MR. BROOMHEAD: Well, I was just going  
17    to say, with this whole rental column, we could  
18    move over to the single family measures thing  
19    also. But I think you're raising a really good  
20    point.

21            It really becomes an issue of what the  
22    building owner knows is going to happen, and if  
23    they know that they're going to have to do to  
24    comply with a unit, then they're going to do what  
25    they know needs to be done to be able to rent that

1 unit.

2           And if they can't provide -- if  
3 electricity can't get hooked up, or the gas can't  
4 get hooked up without changing the account, then  
5 essentially it's non-rentable. And so it becomes  
6 the renter's -- and that's, I believe that's state  
7 law -- you have to have heat and power in order  
8 for it to be a rentable housing unit.

9           And for that to be the case, then it  
10 becomes the landlord's responsibility and  
11 incentive to get all of their units upgraded,  
12 because somebody may vacate at any time. So there  
13 would be kind of a rush -- and that is a problem  
14 in itself in the marketplace.

15           You suddenly get a rush, and then work  
16 gets done badly, and fly-by-night companies spring  
17 up, and it just becomes kind of a nightmare in  
18 terms of enforcement. But you would get a rush in  
19 the marketplace if landlords believed that it  
20 really was going to be enforced.

21           Now in San Francisco we have a rent  
22 control ordinance, and many of our housing units  
23 were built before a certain date come before the  
24 rent board. So we have kind of a different  
25 enforcement mechanism that we would use, but

1 statewide you don't have that. Rent boards are a  
2 pretty rare item in the state.

3 MS. BENNINGFIELD: And one thing we did  
4 do was look at unit-specific measures on rentals.  
5 We didn't look at building measures like window  
6 replacements, ceiling insulation, things that  
7 would be done on a larger than a one unit level.  
8 So that's sort of a box we put around rentals.

9 MR. BROOMHEAD: I would add that our  
10 residential conservation ordinance includes duct  
11 insulation, attic insulation, weather stripping,  
12 water heater blanket, low-flow shower head -- did  
13 I say weather stripping? It was the former PG&E  
14 Big Six, they used to call it in the mid-80's.

15 COMMISSIONER ROSENFELD: But Cal, do  
16 those apply at just change of renter, of tenant?

17 MR. BROOMHEAD: No, they changed it to  
18 the sale of the building.

19 COMMISSIONER ROSENFELD: That's right.  
20 What we're stuck on here are the smaller measures  
21 on change of rental tenants. I think what I hear  
22 from this is, I mean I hear my conscience saying  
23 "don't get into this lightly."

24 On the other hand, I guess what has come  
25 out is, if there is some extremely cost-effective

1 things that, maybe they're just going to boil down  
2 to local charges, I don't know. But the trigger  
3 is probably going to have to be the utility change  
4 in billing. But I think my point is it's not so  
5 easy to enforce any of these rental ones.

6 MR. AHMED: A comment. Perhaps the  
7 measures can remain on the table, but it's the way  
8 ultimately that we administer could determine  
9 success or failure. We might give ten year  
10 timeframes for the property owner to make these  
11 changes. And he could continue to rent it, and he  
12 might decide to make all the changes. So there  
13 are a lot of ways to look into that.

14 MS. BENNINGFIELD: Yes, thank you.

15 MS. HUSSEY: Elaine Hussey, CEC. Is  
16 there an idea of what percentage of renters don't  
17 pay their own utilities, that the owners do their  
18 large buildings? I know older builders,  
19 especially, that aren't individually metered?

20 MS. BENNINGFIELD: Yes, we do have that  
21 data.

22 MS. HUSSEY: Do you have tha data in  
23 terms of how it would affect your triggers?

24 MS. BENNINGFIELD: Yes, we have it. I  
25 don't have it here, but it's --

1           MR. HAMILTON: This is Tom Hamilton.  
2 I'm going to chime in and ride the coattails of  
3 people. That's where you start getting into split  
4 incentives, when you're trying to deal with the  
5 renters with the individual units. Because they  
6 buy a low-flow showerhead and take it with them.

7           Now you're impacting potentially their  
8 security deposit, and the enforcement mechanism.  
9 One general question is that, at some point I'd  
10 like to talk about the appraisal issue for multi-  
11 family, so I don't know if that's now or later,  
12 let me know.

13          MS. BENNINGFIELD: When do you think we  
14 should talk about appraisals? Let's save that for  
15 when we talk about HERS, because we do feel that  
16 appraisal recognition of energy efficiency in the  
17 appraisal process is very important, especially in  
18 commercial buildings, but even in residences.

19          MR. HAMILTON: Yes, more in multi-family  
20 because of the income approach.

21          MR. BROOMHEAD: Cal Broomhead. I think  
22 that if you're going to implement this thing you  
23 would definitely put theonus on the building  
24 owner, not on the tenant. Because you don't want  
25 tenants to be messing around with shower heads.

1           Most building owners don't want that,  
2   because you mess up the plumbing, and those stems  
3   go back into the wall and you'll lose connection,  
4   and the unit leaks and it becomes a mess.

5           MS. BENNINGFIELD:  So that does endanger  
6   the trigger, which is I'm the tenant and I want my  
7   utilities turned on.  I'm the one who's supposed  
8   to take action.  Now I have to get my building  
9   owner to take action, so --

10          MR. BROOMHEAD:  Well, I think the point  
11   that I was making earlier is the landlord can't  
12   rent the place to you, they can't start charging  
13   rent until they have provided those basic  
14   services, and that's state law.  So you would  
15   never be in that position.

16          The landlord would be saying, you know,  
17   dang, I haven't got that certificate filed yet, I  
18   probably can't rent the place until probably next  
19   week.  That's the decision there, and whoever is  
20   the inspector, the people who are, whatever  
21   enforcement mechanism is set up, they're going to  
22   be dependent on is it the utility coming out, is  
23   it the city coming out.

24          You know, who is it is going to come out  
25   and make sure that that shower head is installed,

1 or the thermostat's been installed. Who's going  
2 to certify that, and how do they get that  
3 certified as quickly as possible because these  
4 people just vacated last night, and I'm not going  
5 to get paid my rent this month, and I can turn  
6 around and rent right away, but I don't have that  
7 certificate on that unit.

8           So that's why I say, I think it's going  
9 to create a rush in the market, because every  
10 landlord is going to be afraid that the unit could  
11 be vacated. They'll kind of pick and say "gee,  
12 out of these 50 units in this building I've got 25  
13 of them that could vacate at any time. I better  
14 get a contractor over here and get that work  
15 done."

16           MR. BARDSLEY: Len Bardsley, SoCal Gas.  
17 I think we need to also look at the condominium  
18 issue. Several times you can have condominiums,  
19 50 or 100 in one building, so that's 50 to 100  
20 different owners who all share the same duct work,  
21 this and that.

22           Oftentimes they have councils and stuff  
23 within the boards of those condominiums. But  
24 you're dealing with 100 owners in a very confined  
25 space who would have to come with agreement every

1 time you would have a renter's change with these.

2 And I can see that being a real hornet's  
3 nest, trying to enforce this. It's just not one  
4 owner of a building, it's 50 owners or 100 owners.

5 MR. BROOMHEAD: Well, condo's are not  
6 owned, they're rented.

7 MR. BARDSLEY: No, you can rent condos.  
8 All the time. In fact, --

9 MR. BROOMHEAD: Oh, I see, you own a  
10 condo and rent it out.

11 MR. BARDSLEY: Right.

12 MS. BENNINGFIELD: Yes, it sounds like  
13 there's some logistical issues that can be  
14 addressed, but -- yes?

15 MR. QUINN: My name is Patrick Quinn,  
16 I've been appearing before the California Energy  
17 Commission since the day it was organized. I just  
18 sold my condominium, I've been involved in a  
19 lawsuit that I've reported to certain members,  
20 even those members that are in this room right  
21 this very moment.

22 We've spent over a million dollars  
23 because certain lawyers and certain real estate  
24 people did not understand the specifics of  
25 standardization and functionality. I'm sure that

1 Dr. Arthur Rosenfeld can explain that many times.  
2 Never.

3 Point being is that my condominium was  
4 just inspected within the last 30 days, and the  
5 check just cleared in the last 48 hours. The  
6 point being is that the original test here in  
7 Sacramento -- I happened to be the individual that  
8 performed those tests with SMUD.

9 The purpose of my test was to reveal  
10 diversity of functionality. I have not heard one  
11 word in any of these meetings with respect to the  
12 measurement of functionality.

13 Since 1998, I can go down into any  
14 underground vault put in by the cable system  
15 and/or the phone company and/or the fiber optics  
16 system surrounding ABAG, which is the nine  
17 counties of San Francisco.

18 I can measure any point that you have  
19 discussed here since I walked into this room a  
20 little over an hour ago. My background is  
21 metrology and instrumentation. I can go to any  
22 point in those vaults that are presently  
23 installed, and sample anything you want to look  
24 at, either to the address MPLS or the LSPF points  
25 in the vault system.

1           The question is why cannot we address  
2   those particulars? This gentleman here in the  
3   blue shirt has bounced all around that, but he  
4   mentioned the word historical in terms of  
5   performance. There is no historical performance.  
6   How can we talk about performance historically  
7   when there isn't any, in terms of metrology  
8   aspects.

9           MS. BENNINGFIELD: Okay, Dale, did you  
10   have a point about coordinating performance  
11   issues?

12          MR. GUSTAVSON: Not actually, I was  
13   going to go to the charts, but I'm waiting to  
14   raise my hand again at the appropriate time.

15          MS. BENNINGFIELD: Okay, in the interest  
16   of time let's get through the charts.

17          MR. QUINN: If I may make one comment to  
18   finish, please.

19          MS. BENNINGFIELD: Yes.

20          MR. QUINN: In the past 30 days, in  
21   Europe, in the ISO 14001 series, Schumberger has  
22   already declared that the Centrino mobile commerce  
23   aspects that we're using in this country are  
24   already security-wise so loopy goopy that we  
25   shouldn't even be considering them.

1           This very Commission, when I arrived in  
2   Europe, in Paris, on the 19th of July 1990, were  
3   already using California Energy Commission  
4   criteria to determine what it is you're discussion  
5   here today. ISO 14001 and ISO 9001 and 9002 have  
6   set the criteria for what it is we're discussing  
7   here.

8           We have a convergence problem, and I  
9   don't really hear anybody discussing convergence,  
10   except in the context of what something is going  
11   to be worth beginning in fiscal 2006 and 7, which  
12   is still three or four years away. And that gets  
13   me back to Proposition 53, and why it was voted  
14   no. Thank you.

15           MS. BENNINGFIELD: Thank you.

16           MR. CENICEROS: Thank you, Mr. Quinn.  
17   Dale?

18           MR. GUSTAVSON: Dale Gustavson, Cal-  
19   ACCA. Again, on the multifamily chart, under  
20   HVAC, I note again that refrigerant charge air  
21   flow measurement, and I wanted to make sure that  
22   you take my advice and add the measurement of  
23   energy efficiency and the measurement of capacity,  
24   that it moves from charge to charge.

25           And then secondly, I have a remaining

1 question on the single family table, and I was  
2 going to wait until later, but you opened the  
3 door. You have an X under the alteration for  
4 multifamily, and on that particular measure. And  
5 I'm trying to figure out why it would apply to  
6 multifamily and not single family, because--

7 MS. BENNINGFIELD: Which measure?

8 MR. GUSTAVSON: Well, refrigerant charge  
9 air flow measurement, and per my recommendation  
10 before, we're adding measurement of energy  
11 efficiency and capacity. That if it makes sense  
12 to me to figure it on this chart, then it makes  
13 sense to me that it be on the single family member  
14 as well. So I was confused as to what --

15 MR. PENNINGTON: There currently is a  
16 building standards requirement for refrigerator  
17 charge and air flow, you know, and there is an  
18 alternative that you can install a higher SEER air  
19 conditioner instead. But I think that may be part  
20 of the reason why it doesn't show up here, because  
21 there's already a requirement for --

22 MS. BENNINGFIELD: If there's a high  
23 rise it falls under the non-res standards.

24 MR. PENNINGTON: Oh, that's true.

25 MS. BENNINGFIELD: If it's a low-rise

1 house it would be included in the residential  
2 standards. So it's kind of a split case depending  
3 on the type of multifamily building.

4 MR. GUSTAVSON: On page 22 of the  
5 report, on the residential chart, when one looks  
6 at the comment for refrigerant charge and air flow  
7 measurement, it says "if the unit is a candidate  
8 for retrofit and a track system is involved."  
9 There's nothing said there about some other  
10 requirements.

11 And I just think, speaking on behalf of  
12 the HVAC industry, there's definitely  
13 opportunities at single family, at the alteration  
14 stage, to require what might better be called  
15 commissioning of that particular system or those  
16 components within the system.

17 And having had a permanent trigger, then  
18 there may be an opportunity there. That's all.  
19 So it made sense to me on multifamily, and as time  
20 expired on the other I was going to let it go to  
21 the end, but you put the X. I'm saying let's put  
22 it in single family too, because it's the --

23 MS. BENNINGFIELD: Sure, we'll rectify  
24 that.

25 MR. GARCIA: Lynn, Al Garcia here. I

1 have a follow-on question to that. And I'm not  
2 sure if I'm reading this table right, but both for  
3 the multifamily and the single family there is not  
4 X's on either the air conditioning or boiler  
5 upgrades.

6 And it just seems to me that if we've  
7 got -- whether it's a single family or a  
8 multifamily, where you've got an old package unit  
9 that's got a SEER rating of 8, and the place is  
10 being sold, gosh what a wonderful opportunity to  
11 replace it with a much more efficient unit. Am I  
12 reading this thing wrong?

13 MS. BENNINGFIELD: I don't think so. I  
14 think, in the context of say a HERS rating, where  
15 I come into your home and I determine that there's  
16 an 8 there, and that means your score is lowered  
17 quite a bit, then in that circumstance certainly  
18 requiring a replacement might be an idea.

19 We didn't put it because unilaterally  
20 it's not smart from a first cost standpoint to  
21 require replacing of major equipment on just  
22 change of ownership solely. So there may be some  
23 conditions by which it is cost-effective, and we  
24 may capture those with some of the mechanisms  
25 we're developing, but requiring you to replace

1 your air conditioner when you sell your house, if  
2 it's more than X years old, we feel is going to be  
3 a first cost issue.

4 COMMISSIONER ROSENFELD: This gets back  
5 to Nancy Jenkin's point. Maybe if you look at the  
6 return on investment then maybe it doesn't pay to  
7 replace an old 8, but maybe sure as hell it makes  
8 sense to replace an old 5. And just to have a  
9 blank here, without the words "depends on cost-  
10 effectiveness" is confusing.

11 MS. AUSTIN: We do have in the report,  
12 it says "applies when unit is performing poorly."  
13 But we couldn't figure out, what should we say is  
14 the threshold, or figuring out what the threshold  
15 would be would be a discussion for later, when  
16 we're talking about an upgrade because when do you  
17 draw the line?

18 MR. PENNINGTON: This brings up a major  
19 dilemma with how you approach a retrofit on sale  
20 strategy. Because, in general, all the houses are  
21 going to be at different points. Some of them are  
22 going to have retrofit installation installed,  
23 some of them are going to have an air conditioner  
24 that's about to die, and some of them are going to  
25 have an air conditioner that has, you know, ten

1 years left on its life.

2 And it doesn't make sense to throw away  
3 something that has a long life. And so if you  
4 approach the point of sale issue with well, what  
5 are the things that I know I can do in every  
6 house, you end up with a very short list, and you  
7 end up with potential savings that are far less  
8 than what people imagine is possible in all the  
9 retrofit sectors.

10 So you end up with a Big Six kind of  
11 strategy, which even that was difficult  
12 politically to get to happen when it was attempted  
13 to be done at the state level. You got a few  
14 communities going for that, but you have, in terms  
15 of the potential that you imagine you're talking  
16 about one to five percent of the total potential  
17 that you could get to have happen in every house.

18 And so if you think that the point of  
19 sale event is a fundamentally important event than  
20 you need to have some way of evaluating, on an  
21 individual house basis, what's reasonable for that  
22 house. And set up a system for doing that.

23 And I think that's kind of a fundamental  
24 dilemma here, that the report was trying to  
25 anticipate, that well, no, it doesn't make sense

1 to require for every house that you do X.

2 COMMISSIONER ROSENFELD: Bill, I  
3 completely agree with what you said. On the other  
4 hand, once you introduce the word idnvididual, I  
5 guess the question you have to address as a  
6 working group is are there some air conditioners  
7 which are so inefficient - I mean, you know, it's  
8 17 years old and has a SEER of 5 -- that that  
9 individual you work out should be required.

10 Or is your question is that it's such a  
11 tiny fraction of the market that it's just not  
12 worth it?

13 MR. PENNINGTON: If you're talking  
14 about, you know, a very large price, the price of  
15 a new air conditioner is so large compared to your  
16 relative savings that you have to be sure -- I'm  
17 not sure that a 5 is going to be cost-effective if  
18 you have 14 years of useful life left on your air  
19 conditioner.

20 So it's a hard thing to evaluate in a  
21 global way. You can't do it on an individual  
22 house basis, I agree with that.

23 MS. BENNINGFIELD: And you'll see this  
24 afternoon -- we're kind of alluding to that now --  
25 probably the best trigger event a house still

1 provides is someone to go in and evaluate where  
2 the systems are. Is the refrigerator brand new,  
3 is the air conditioner ten years old, are the  
4 ducts leaking?

5           You wouldn't want to stop with replacing  
6 a 5 SEER with a, you know, 12, you'd want to go in  
7 and do the duct diagnostics and upgrade them as  
8 well, which adds cost. So I think the prime  
9 opportunity is a chance to look at an individual  
10 house and see where the most cost-effective  
11 upgrades could be at that house.

12           And I think we'll be discussing that a  
13 little further this afternoon. But there are,  
14 like Bill alluded to, there are a few things that  
15 under all, in all single family residences in the  
16 whole state of California, if -- for example,  
17 ceiling insulation.

18           If a house doesn't have any ceiling  
19 insulation it would certainly be cost-effective at  
20 time of sale to require a retrofit of ceiling  
21 insulation. I think all of us would agree to  
22 that.

23           Beyond that there aren't that many  
24 measures that don't require a set of caveats --  
25 where is it located, how severe is the weather in

1     that location, how old is the equipment, how is it  
2     operated, and so on. So it's very complex. Yes,  
3     Cal?

4             MR. BROOMHEAD: Our San Francisco  
5     residential ordinance has a monetary cap on how  
6     much money the landlord is required to spend, and  
7     so -- I think it's \$1,500 right now. Then it's up  
8     to the landlord to decide which of the things, or  
9     the owner, from the sale, which of those things  
10    they're going to do.

11            So they're probably going to replace the  
12    equipment that they know might come back to haunt  
13    them in the next six months if it broke. Like the  
14    air conditioner or refrigerator or something else  
15    that might require -- another way to hand that  
16    might be, this whole question, might be that if  
17    you're going to require HERS as part of it, is to  
18    require a minimum HERS rating, and then whatever  
19    they want to do to get there is up to the  
20    negotiation between the contractor and the owner.

21            MR. GUSTAVSON: Dale Gustavson, Cal-  
22    ACCA. I may have missed it in the report, but I  
23    don't think so, I've been looking for it. There's  
24    a trigger event, or maybe an opportunity that I  
25    don't even know what category to put it in, it has

1 to do with home warranty replacement of air  
2 conditioning.

3 And having lived through it personally  
4 recently I, there's an industry, a rather large  
5 one, where there are opportunities at a high level  
6 to impact a decision being made by the insurance  
7 company that's doing the installation or the  
8 replacement.

9 So -- and I don't know if that would  
10 fall under alteration, but it probably would -- if  
11 in fact the replacement companies are requiring  
12 their contractors to get adequate permits to do  
13 the replacements, which I doubt based on my  
14 personal experience recently.

15 But I had a home warranty, extended it  
16 -- which I think is becoming more commonplace.  
17 You purchase a home that's a used home, and then  
18 they call you and want you to extend the warranty.  
19 And then one of my air conditioners broke, and the  
20 replacement was to be a 10 SEER unit.

21 As it turned out, the proposal from the  
22 company that was doing the installation was the  
23 wrong size replacement. So there's -- it seems to  
24 me there's huge opportunity there, because there  
25 may be a way to regulate those who are doing the

1 replacing, and make sure that they're doing a good  
2 job at the right level of efficiencies, and maybe  
3 attacking the rest of the system as well.

4 But if that's not their responsibility,  
5 if the rest of the system is not something that  
6 they're interested in financially looking at, the  
7 replacements might be reduced, if the people doing  
8 the testing to determine whether they need to be  
9 replaced are using the right kind of diagnostics  
10 to determine whether the units need to be replaced  
11 too, you know, it works both ways. It may be an  
12 opportunity, and I don't know what box to put it  
13 in.

14 MS. BENNINGFIELD: Okay, thank you.  
15 Just a couple more comments, then we'll go to the  
16 commercial table. Yes?

17 MS. GLASSEL: Bobbi Glassel with energy  
18 efficient mortgage. I work with HERS ratings on a  
19 daily basis, and to answer Bill's question, what  
20 will we do to improve that home -- correct, is  
21 that what you're saying? What would be the best,  
22 every home is different, every family is  
23 different.

24 I find that the people who have ordered  
25 their HERS rating are knowledgeable. Many times

1     there is not enough money laying on the table for  
2     all of the upgrades, and they have a choice. They  
3     might do wall insulation, attic insulation, and a  
4     whole house fan. And that's all the extra money  
5     they have.

6             Or they might do an upgrade on heat and  
7     air. But the average home is sold every five to  
8     seven years anyway, somebody moves. So in seven  
9     years now we have new attic insulation that's  
10    still good, maybe in five to seven years we might  
11    add at the same home a new heat and air.

12            But the HERS rating -- and I do use  
13    CHEERS, not just because Tom is sitting here -- we  
14    have to be cost-effective. So, in other words, if  
15    the payment goes up and -- my funds come from the  
16    lender -- I can't go and say "oh, you can have new  
17    heat and air, and it's going to save you \$20 a  
18    month, but your payment is going to go up \$30,"  
19    that won't work.

20            But the HERS rating itself is a very  
21    accurate guideline on what they can and cannot do  
22    cost-effectively. And the home warranty? I've  
23    been in the real estate industry since 1979. They  
24    will tell you, you go lucky, most of them will  
25    tell you it's a pre-existing condition and we're

1 not going to replace it.

2 Or they're going to take that old 5 SEER  
3 junker and put a \$50 part and make it keep  
4 cranking away. So --.

5 MR. RIEDEL: This is Randel Riedel,  
6 Energy Commission. I have one comment to be made  
7 in regards to the discussion around nameplate data  
8 in equipment, such as there has been discussion of  
9 SEER 5, 10 or whatever.

10 And I think we also need to be careful  
11 in whatever evaluation process we're doing. If we  
12 have the ability actually to measure the actual  
13 performance or efficiency of the equipment, rather  
14 than just go on the assumption that the nameplate  
15 is telling us exactly what the efficiency or  
16 performance of that equipment is.

17 We need to pay attention to that in our  
18 cost-effectiveness evaluation. So that's it.

19 MR. BROOMHEAD: Cal Broomhead. Just to  
20 respond, Randy, I think that's a wonderful thing  
21 to be able to do, but the first question I ask is  
22 what's the status of the industry, of the people  
23 who would be going into the buildings to be able  
24 to even identify, look at the nameplate. Do they  
25 ever do that? Do they understand that at all?

1           And could they perform any kind of  
2   performance testing? Would they have the tools  
3   for it, would they have the training for it, and  
4   how do you certify them, and etc. It's a whole  
5   another thing. Whereas it's easy to go, "yeah,  
6   air conditioner, yeah, they got a furnace, yeah,  
7   there's attic insulation."

8           MR. QUINN: Mr. Chairman, can I make one  
9   more comment please?

10          MR. CENICEROS: Well, we were just about  
11   to move on to the next section --

12          MR. QUINN: I think it's critical I make  
13   a comment to Mr. Riedel's most recent statement.

14          MR. CENICEROS: Okay, just keep it to 30  
15   seconds or so, please?

16          MR. QUINN: I cannot hear you, sir, I'm  
17   deaf in my right ear.

18          MR. CENICEROS: Okay, why don't you go  
19   ahead, and if you'll keep it to 30 seconds or  
20   less, maybe we can move on to the next subject?

21          MR. QUINN: This is to do with the very  
22   detail this lady brought up. I worked with ARI on  
23   the various test labs, and the obsolete test  
24   methods they have been using up to this moment in  
25   time, in terms of whole compartments -- in other

1 words, zonal measurement versus whole house  
2 measurement.

3 That's the reason I brought these  
4 particular magazines, is so that the detail that's  
5 transmitted from the two points in the bolts that  
6 have been installed in most of the major cities,  
7 of the hundred major cities around the entire  
8 United States, have the capability, either within  
9 the dec system or within the java system, to  
10 detail those particular items.

11 And I'm giving this to you as evidence  
12 for that messaging of information, because ever  
13 since the beginning of fiscal 1993 most of your  
14 major appliances, whether their reading plates  
15 were within the national electric code or not, and  
16 however long they've been installed or not, the  
17 static information that was there had nothing to  
18 do with functionality nor the standardization of  
19 functionality.

20 That's what we're here to talk about, is  
21 how to measure that. Not static situations. I  
22 worked at Boeing in advanced test labs for 16  
23 years, and the standardization of functionality is  
24 what we should be talking about, and the messaging  
25 that's required from the zonal points of any given

1 occupancy building. And we're talking about  
2 occupancies. Thank you. May I give these to you?

3 MR. CENICEROS: Thank you, Mr. Quinn.

4 MS. AUSTIN: For the commercial factor,  
5 there's a lot more information on the tables. We  
6 divided it up to six occupancy types -- office,  
7 retail, grocery, restaurant, warehouse and school.  
8 The same trigger events that were used in  
9 multifamily is used in commercial, except for  
10 rental you have lease.

11 I know it's a lot more information to  
12 gather and digest.

13 MR. GUSTAVSON: Cynthia, quick question.  
14 In the report, in one table, theaters and movies  
15 were pulled out, and I'm wondering are they part  
16 of retail? There's a lot of square footage, and I  
17 was amazed when I looked at your chart and it  
18 actually showed commercial office had about the  
19 same footage as theaters in the state of  
20 California, which, I guess that surprised me  
21 because there's now a multiplex on every corner.

22 Where are theaters in this chart? They  
23 were in one, and they seem to be missing from the  
24 others?

25 MS. AUSTIN: We don't address theaters

1 at all. I'm trying to look for that table you  
2 spoke of.

3 MR. GUSTAVSON: Me, too, I was amazed by  
4 the square footage, it just jumped out, like "wow,  
5 how did we miss this?"

6 MS. BENNINGFIELD: Is it page 12?

7 MS. AUSTIN: Oh, we have something on  
8 the average floor area of a theater, but as a  
9 percentage of the total commercial building floor  
10 space in California, I still think it's one of the  
11 minor ones.

12 MS. BENNINGFIELD: All that table is  
13 saying is that theaters are large, on average, not  
14 that they constitute a large portion of commercial  
15 floor space in total.

16 MR. GUSTAVSON: Right, but first, on a  
17 square footage basis, in my mind translates to how  
18 much air conditioning.

19 MS. BENNINGFIELD: Yes, and all the  
20 people in the theaters generating the heat.

21 MR. GUSTAVSON: Yes, so is it in retail  
22 or is it in office, or is it just not addressed?

23 MS. AUSTIN: It's not addressed.

24 MR. GUSTAVSON: Okay, I believe it  
25 should be.

1 MS. BENNINGFIELD: Feel free to mark it  
2 up, and let us know.

3 MS. MCCORMICK: I'm Anne McCormick with  
4 Newcombe Anderson, and I had a quick question on  
5 the categories, and I apologize because I don't  
6 know the history, if this question is out of  
7 context.

8 But I was curious about the hospitality  
9 sector -- hotels, motels -- and also hospitals and  
10 health care sector, if they belong in the  
11 commercial snapshot or if they're there somewhere  
12 else?

13 MS. BENNINGFIELD: The hospitals --  
14 you're asking about institutional occupancies as  
15 well as hotels and motels? Okay.

16 We did not include institutional  
17 occupancies. They are not currently covered by  
18 the building energy efficiency standards. That  
19 doesn't mean that they can't be on the table for  
20 evaluation purposes.

21 MS. MCCORMICK: I mean, I almost  
22 think it would be more of an opportunity.

23 MS. AUSTIN: I also wanted to get at,  
24 what we found in our research is that they were a  
25 small percentage of the total floor space. We

1     tried to take the top, you know, couple of the  
2     spaces -- office and retail and warehouse and  
3     school.

4             MS. MCCORMICK: I would hope it wouldn't  
5     be just percentage of floor space, but percentage  
6     of energy use that you're looking at. Again, I'm  
7     just concerned that health care might be a missed  
8     opportunity here.

9             MS. BENNINGFIELD: That's a good point.

10            MR. BROOMHEAD: Yes, I would think the  
11     hotel, motel and hospital, along with probably the  
12     food service, have the highest energy utilization  
13     indexes.

14            MS. BENNINGFIELD: Yes, we have included  
15     schools in there, but we will expand that. Are  
16     there particular kinds of measures that people  
17     would like to bring up associated with those  
18     occupancies?

19            You can see me at the lunch break, or  
20     fill out one of the forms and leave it with us.  
21     Because certain uses would dictate us to look at  
22     certain kinds of measures.

23            MR. CENICEROS: Paul, did you have a  
24     question?

25            MR. DUDLEY: Yes, Paul Dudley with

1 Bristolite Industries. I finally get a chance to  
2 talk about daylighting, my passion since the early  
3 80's.

4           And around 1981 I started to make my  
5 living exclusively by designing daylight systems,  
6 and I'm wondering -- and at first of course it was  
7 by retrofitting individual buildings, and the big  
8 box concept hadn't really taken hold, and people  
9 didn't really know that you could do these kinds  
10 of things in a retail space, because what would  
11 happen to the people if they actually had sunlight  
12 on them.

13           But, in any case, I'm wondering then why  
14 we haven't included other types of retail besides  
15 grocery, and why we haven't included warehouses,  
16 which I would imagine also would include  
17 factories, which are large consumers of lighting  
18 energy.

19           MS. BENNINGFIELD: You're right about  
20 the warehouses. In 2005 the prescriptive  
21 requirements are going to be that skylights are  
22 required of 15 foot ceiling heights or more and  
23 25,000 square feet or larger spaces, which  
24 includes the big box you're talking about, and  
25 most warehouse facilities.

1           I don't know if it was an oversight, or  
2   because we thought it was impacted by the  
3   standards. I'll have to look at our notes as to  
4   why that particular occupancy doesn't have an X.

5           Grocery has an X because it doesn't  
6   always meet that 15 foot, 25,000 criteria, and we  
7   think that's the next logical level to apply  
8   daylighting techniques, to require them.

9           MR. DUDLEY: Another comment I'd like to  
10   make also. Because I had to make my living at  
11   doing this, I had to figure out what worked and  
12   discard what didn't work. And the number one key  
13   issue of course is when you're voluntarily trying  
14   to get people to do these kinds of things is to  
15   have money available.

16           And companies are like people, they  
17   don't have a lot of money available for this kind  
18   of stuff. You talk about buying a new plastic  
19   injection molding machine that's going to pay for  
20   itself in three months or something, and it's the  
21   owners passion that he's going to buy it in a  
22   second.

23           But when you're talking about cutting  
24   200 holes in his roof and putting skylights in  
25   he's not too excited about it. But, so once we

1 get through the process of convincing him that  
2 that's all okay and he's not going to die or  
3 anything like that, the other issue is then  
4 getting the funds for it.

5 And, you know, we're probably dealing  
6 with a rate of, maybe, in retrofit maybe a 20  
7 percent rate of analyses that we do versus jobs  
8 that we do. So either I'm a bad salesman or I'm a  
9 good salesman and I would have only had ten.

10 But one of the most important issues  
11 when it comes down to it, after everybody agrees  
12 this is a good thing to do is we don't have any  
13 money, or you need to wait for next years' budget,  
14 or, you know. And I've had company after company  
15 put these measures into bid for budget, you know.

16 For instance, JC Penney's 1,600,000  
17 square feet of warehouse, eight years and finally  
18 they got the budget to do it in fourths. So when  
19 we're talking about trigger measures, also we're  
20 talking about something that's going to have to be  
21 palatable when you get through with this report to  
22 the congresspeople, and politically is going to be  
23 able to be passed and be put into law.

24 The trigger issues, it would be very,  
25 very helpful if they happened at a time when the

1 person that's going to have to pay for them would  
2 have money available, either through financing or  
3 through a sale or something of that nature. And I  
4 see some of these trigger points don't have that.

5 And so you'd just be forcing a person to  
6 pay out of his pocket for something that the  
7 government said "you have to do." And that's not  
8 very palatable. So, just a comment that, if that  
9 could be included. If trigger issues could be  
10 made at the point where at some point there is  
11 funds available for the person who's going to have  
12 to pay for them, through financing, would be  
13 really helpful.

14 MS. BENNINGFIELD: Okay, so in the case  
15 of a grocery alteration, it could be conditional  
16 on whether they are re-roofing or not. If they're  
17 re-roofing they have money available for that,  
18 then it may be the time to require skylights, or  
19 to require them to do the feasibility analysis for  
20 skylights.

21 MR. DUDLEY: Yes.

22 MS. BENNINGFIELD: Okay, thank you.

23 MR. CENICEROS: There's another side to  
24 that, too, and I don't know if you're implying or  
25 not, Paul, and that is the possibility to at least

1     acquire information on available programs that  
2     finance this type of improvement whenever this  
3     particular trigger happens. Is that something  
4     you're also --?

5             MR. DUDLEY: Yes, and also -- I told you  
6     about an idea that I had that I've written up for  
7     you regarding government insured loans for this  
8     kind of stuff. If you, the other issue of course  
9     if money out of pocket.

10            If you had a government insured loan for  
11    a energy conservation move that was going to pay  
12    for itself in five years, and a loan was for,  
13    like, seven or eight years, and the payment on the  
14    loan was less than the monthly energy savings, it  
15    would just be a done deal. Anybody'd be foolish  
16    not to do that.

17            And that, however, would be a very  
18    complicated logistical system to set up. I think  
19    once it got set up it couldn't be complicated or  
20    it wouldn't work. But once it got set up it would  
21    be really a great thing.

22            MS. BENNINGFIELD: Thanks. I'm feeling  
23    we need to wrap up here, I'm getting a couple of  
24    cues from people. We're ten after 12 now, and the  
25    agenda calls for lunch break at noon. So do we

1 still want to resume at 1:00 or do we want to make  
2 it 1:15?

3 MR. CENICEROS: Well, first of all, do  
4 we have any more comments on the commercial table  
5 that people didn't have a chance to get in? A  
6 show of hands? I don't want to do it now, we can  
7 pick up after the lunch break, or whether we  
8 should do it now.

9 So why don't we break now and return at  
10 1:15, is that okay with everybody? Cal?

11 MR. BROOMHEAD: Yes, the roof attic  
12 insulation will come, I'll add it. Were you  
13 thinking that there would be differences according  
14 to the different climate zones in the state?

15 MS. BENNINGFIELD: Yes.

16 MR. BROOMHEAD: Because San Francisco  
17 roof insulation on commercial buildings is not  
18 going to do much.

19 MS. BENNINGFIELD: Yes, thank you.

20 MR. CENICEROS: Okay, we'll go ahead and  
21 break for lunch. I think you'll find the  
22 afternoon session will be even more interesting a  
23 discussion than this one, we'll really get into  
24 some of the more promising strategies, and address  
25 some of the more challenging issues that people

1 are already alluding to here about how to assess  
2 opportunities in different kinds of buildings, and  
3 get around all the different complexities and  
4 exceptions in every building. Enjoy your lunch.  
5 (Off the record.)

6 MR. CENICEROS: Okay, we're coming back  
7 on the record at 1:19 by the clock on the wall,  
8 which is a little bit fast. Lynn Benningfield  
9 from Heschong Mahone Group is going to continue  
10 facilitating the afternoon portion of our agenda.

11 We're going to look at key focus areas  
12 that they have identified, and later give you an  
13 opportunity to suggest additional areas if you  
14 think this doesn't cover it. Lynn?

15 MS. BENNINGFIELD: Thank you. Okay,  
16 we're going to structure the afternoon a little  
17 bit differently. We're going to introduce the  
18 topic, and then give comments on that, and then  
19 proceed to the next topic area.

20 We've identified these five good areas  
21 that we think show promise for saving energy in  
22 buildings, and I want to go through our reasoning,  
23 our rationale, and then we'll have time to talk  
24 about each one.

25 There's two kinds of strategies that

1 work. One that we can use in the short term, it  
2 uses proven mechanisms and proven technologies,  
3 and proven cost-effective measures. Sort of a  
4 yes/no question. Is it in the house, is it in the  
5 commercial building? Yes/no, if not then it could  
6 be installed.

7           There are longer term strategies that  
8 would require expansion of authority and would  
9 require more consensus building and preparation.  
10 And so some of those do take a little bit more  
11 time and they might require some voluntary  
12 intervention for them to be successful.

13           Okay, here are the five bulleted items.  
14 Of course, we want to go for the low hanging fruit  
15 first, which is to look at the building and the  
16 appliance efficiency standards, look at the margin  
17 of the authority there, look at ways that they  
18 could be expanded somewhat to impact existing  
19 buildings a little bit more.

20           Rate the relative efficiency of  
21 buildings and evaluate cost-effective  
22 improvements. This is a rather large topic that  
23 includes looking at the HERS protocol on the  
24 residential side, and then would look at  
25 retrocommissioning and fine-tuning of commercial

1 buildings on that side.

2 We also want to do what we can to  
3 encourage use of controls, and by that I mean  
4 effective use of controls so that they are user-  
5 responsive and they aren't bypassed by the user,  
6 but the basic idea of not using the energy when  
7 it's not needed is the basis behind expanding use  
8 of controls.

9 Support special tariff and demand  
10 response programs. And this is a very good timing  
11 opportunity I believe for looking at what kinds of  
12 restructuring of the rates are happening at the  
13 utility level now, and how that can be used to  
14 encourage improvement in buildings.

15 And then last we want to look at  
16 facilitating development and adoption of model  
17 retrofit ordinances. We feel that community based  
18 grassroots level had been very effective and we  
19 want to learn why and also maybe provide support  
20 at the statewide level, sort of a framework by  
21 which local ordinances could have similar  
22 attributes that maybe in the long term could  
23 evolve into a statewide mandate.

24 So the format for discussion is I'll do  
25 a little bit of explanation, and then I want to

1 hear from you, your comments. Especially if you  
2 have experience in the area, what the lessons  
3 learned are, maybe the implementation issues, any  
4 savings estimates you might have, what would be  
5 required in terms of consensus building to make  
6 the thing actually work. What barriers do you see  
7 in the way, and what could be facilitated to  
8 remove those barriers.

9           So let's first talk about expanding the  
10 building and appliance standards regulations.  
11 Okay, what's good about looking at that as a way  
12 to impact existing buildings?

13           Well, there's two reasons. One is that  
14 new measures can be quickly adopted. There's  
15 already a process that involves consensus-  
16 building, that involves technical hurdles that  
17 need to be jumped through, and that involves the  
18 public in terms of accepting a new requirement.

19           Also the enforcement channels are well-  
20 established, they've been established over the  
21 years. Particularly where a building permit is  
22 required. Building departments are used to  
23 enforcing the standards, so if we can just expand  
24 those to new areas we can use the existing  
25 mechanisms and maximize the potential.

1           Okay, what are we looking at when it  
2 comes to proposing expansionary standards? Some  
3 of the items we came up with are looking up  
4 landscape lighting and controls. Perhaps lowering  
5 the threshold for non-residential lighting  
6 alterations.

7           Right now, in a commercial building, if  
8 50 percent or more of the fixtures need to be  
9 replaced for it to be considered a lighting  
10 alteration and for the code to be triggered, and  
11 that could be lowered.

12           Occupancy sensors. Maybe requiring  
13 occupancy sensors in small offices on a retrofit  
14 basis. That is not a requirement of the current  
15 code, but definitely controls are encouraged for  
16 power adjustment factors and there are  
17 requirements for sweep controls and some local  
18 controls in the standards now.

19           But at the time of sale or at the time  
20 of lease it's fairly easy and cheap to retrofit an  
21 occupancy sensor in a building where one, in a  
22 space in a building where one or two might make  
23 sense.

24           And then also we're looking at expanding  
25 the requirements for cool roofs. Right now

1     there's only certain slope requirements on certain  
2     types of roofs that are required to be retrofitted  
3     with cool roofs, all the others are exempt. So we  
4     can look a little bit more closely at that  
5     criteria, see if there's any room for improvement  
6     there.

7             And then, requiring replacement boilers.  
8     This is a very specific recommendation, but in the  
9     multifamily sector there's a lot of central  
10    systems where the pumps are not really controlled,  
11    or they're not controlled effectively.

12            And it's a relatively easy retrofit to  
13    go into a multifamily building, say at the time of  
14    sale. Is the control there for the research, if  
15    not then require that it be put in.

16            Since we're talking about the building  
17    standards area, if their boiler is replaced it's  
18    akin to looking at duct ceiling now when you're  
19    putting in an HVAC system, replacing that. When  
20    you replace a boiler you look at the distribution  
21    system of that boiler, and where there needs to be  
22    a control on a re-circuit go ahead and require it.

23            Okay, the next slide talks about  
24    appliance standards expansion areas. And again  
25    we're looking at lighting, and when we're talking

1 about landscape lighting there's two ways you can  
2 look at it. You can look at the landscape as a  
3 system, you know, several connected lights.

4 And that would fall under the auspices  
5 of the building efficiency standards. Or you can  
6 look at specific luminaires that are utilized in  
7 landscape lighting typically, and those could be  
8 regulated under appliance efficiency standards,  
9 the efficacy of those lamps.

10 Also, we're just now getting into  
11 outdoor lighting with the 2005 standards. And  
12 we're also getting into expanding residential  
13 lighting efficacy, and there's a kind of an  
14 inherent problem when you're looking at pin-based  
15 fixtures. There's so many pin types out there,  
16 and there's so many choices that that was revealed  
17 as a problem in implementing residential lighting  
18 requirements.

19 If I'm required to install hardwire  
20 fixtures I'd only have one wattage choice because  
21 I have a certain pin configuration. Then what  
22 happens when that lamp fails and I need to go to  
23 Home Depot and replace it? I might not find the  
24 appropriate pin configuration. It might be  
25 difficult to do.

1           And the manufacturers recognize this  
2 problem. It's not as big of a problem in  
3 commercial. But they're trying to work with  
4 Energy Star and other programs to sort of limit  
5 the consumer choice in terms of range of options  
6 so that it makes it simpler to purchase that.

7           And appliance efficiency standards could  
8 have a role in it, in terms of what kinds of pin  
9 type configurations might be acceptable for a  
10 compact fluorescent hardware lamps.

11          Also, there's differing opinions about  
12 the effectiveness of residential setback  
13 thermostats. We've heard everything from they can  
14 actually use more energy and people tend to bypass  
15 them, people operate their homes as if it was on a  
16 gas pedal, you know, turn it up, turn it down.

17          So there's definitely a problem. We're  
18 not getting the savings that we thought we would  
19 be getting and were expecting of residential  
20 setback thermostats in general. So I think,  
21 looking at that area and trying to get a fix for  
22 that also would help. And that could be done  
23 through the appliance efficiency standards.

24          For the standards in appliance  
25 efficiency topic areas now is the time to give

1 some feedback. Areas that we may have overlooked,  
2 areas that you would like us to look further into.  
3 Concerns, issues -- anybody have any input?

4 We've been working with the CEC team and  
5 Bill Pennington to examine where the boundaries of  
6 the current authority is, and we feel that this  
7 set of measures that I've just discussed are  
8 relatively quick burn items that can be  
9 implemented quickly and start saving energy right  
10 away.

11 And the rest of the discussion this  
12 afternoon is going to be on things that will  
13 probably require a little longer-term strategies  
14 to be successful. So, -- yes?

15 MR. HAMILTON: Tom Hamilton. On the  
16 non-res, when an alteration -- a little bit back  
17 to the table -- an alteration is basically a  
18 building owner that puts on a new face or guts the  
19 building that's specific to the building, and then  
20 a lease is when a new tenant comes in.

21 When you do a new lease and you  
22 negotiate the tenant improvements, a permit is  
23 required to be pulled at that time, is that  
24 correct?

25 MS. BENNINGFIELD: Yes, that's an

1 alteration.

2 MR. HAMILTON: So you would have the  
3 authority then at that point to implement, but you  
4 would probably only affect HVAC and lighting at  
5 that point, for commercial?

6 MS. BENNINGFIELD: Yes, it depends on  
7 the extent of the TI that they're looking for.  
8 But typically it's lighting and occasionally HVAC.  
9 But there's some opportunities within that,  
10 because they would need a permit, there would be  
11 an alteration, even though it is triggered by a  
12 lease.

13 So all the measures would apply that  
14 would apply to an alteration. But because it's a  
15 lease trigger it's not impossible to conceive that  
16 other things could be done at the time of the TI.

17 Some standard things that might be cost-  
18 effective to do at the time of lease. Because one  
19 of the key cost-effectiveness criteria is is  
20 someone in there working in that system anyway?  
21 How much does it cost to get the technical  
22 expertise to the building?

23 So once you have that there -- I mean,  
24 it could be done through a voluntary mechanism,  
25 and it could be done through a mandatory

1 mechanism, but if you're having someone install a  
2 larger air conditioning unit for example it would  
3 be good to also make sure that system is  
4 performing as it was intended.

5 MR. HAMILTON: Because one of the items,  
6 I just thought of it as you were talking with the  
7 lighting, of upgrading the LED exit signs, of  
8 making that a requirement. Those all seem to be  
9 cost-effective.

10 MS. BENNINGFIELD: Yes. Yes, Dale?

11 MR. GUSTAVSON: Dale Gustavson, Cal-  
12 ACCA. I wonder if there's some opportunity on the  
13 commercial side of building standards for maybe  
14 lowering the threshold of requirements of the  
15 installation of economizers from the current  
16 tonnage to something below what the industry  
17 gravitated towards, which of course was the  
18 tonnage just below the existing standard.

19 And at this time in history it may not  
20 be as onerous as having attacked that through code  
21 in the past, because a newly installed economizer,  
22 with the right kind of solid state enthalpy  
23 control, and demand control ventilation, which is  
24 something that's moving into standard, that's  
25 integrated -- especially light commercial -- with

1 setback thermostats, are very likely to work for a  
2 long time, if they're properly commissioned in the  
3 beginning.

4               So there may be an opportunity three.

5 We know that some 85 percent of economizers aren't  
6 working, so whatever the trigger event happens to  
7 be, maybe we should be putting economizers on four  
8 ton air conditioning units or something. I, you  
9 know, the cost-effectiveness of that may not pan  
10 out, but it might. Especially if there's  
11 equipment on the units that would provide for the  
12 installation of just the controls.

13               MS. BENNINGFIELD: Okay, good  
14 suggestion. Any other comments on standards based  
15 mandates?

16               MR. AHMED: Lynn, I have a question. If  
17 we have comments later on, may we mail them to  
18 you?

19               MS. BENNINGFIELD: Yes.

20               MR. AHMED: Later on, after we've  
21 reviewed some of the material from today?

22               MS. BENNINGFIELD: Yes, comments can be  
23 mailed to us. We're scheduled to complete the  
24 next phase of the project relatively soon, so the  
25 sooner the better. But also we're available for

1 phone calls and discussions, because now is the  
2 time when we're looking at the particulars of  
3 implementation.

4           Okay, let's start talking a little bit  
5 about building rating and building evaluation and  
6 whole building performance issues. Rating the  
7 relative efficiency of existing buildings is  
8 informative but does not in and of itself save  
9 energy. When measure is adopted as part of a  
10 recommended strategy then the energy savings  
11 occurs.

12           In residential buildings the home energy  
13 ratings system provides the standardized  
14 evaluation of the homes' energy efficiency, and  
15 then in commercial buildings the closest thing to  
16 an equivalent would be retrocommissioning.

17           Actually, when a building is  
18 commissioned there is fine-tuning done at the same  
19 time, whereas a HERS rating there may or may not  
20 be any intervention as part of the evaluation.  
21 And also there's other differences which of course  
22 we'll talk about in a few minutes.

23           But these are evaluation intervention  
24 tools with lots of regulatory opportunities,  
25 especially during the trigger event of a building

1 sale or even a building lease. And these are very  
2 promising areas because they look at an individual  
3 building and the individual variances within that  
4 building. So energy savings can be optimized for  
5 that particular condition.

6           So home energy ratings. They can be  
7 used in a variety of ways to motivate building  
8 owners. Evaluation could be required at time of  
9 sale. Here's your house score, here's your  
10 neighbor's house score, that could be the mandate.  
11 The utility program could then pick up and  
12 encourage an owner to do certain things as a  
13 result of that.

14           Is your score lower than this? Then why  
15 don't we do X, Y, and Z to your house, and here's  
16 a rebate, by the way. There's lots of creative  
17 ways we can look at how to use the rating itself  
18 as a way to incent people to make a change in a  
19 building.

20           Also, certain benchmark performance  
21 criteria could be established and required. Like  
22 is your house a score of X. If it's below that  
23 you're going to be required to make some  
24 improvements to get it above that threshold. If  
25 it's already above the threshold you pass, if it's

1 somewhat higher above that threshold you might  
2 qualify for some type of carrot, like a special  
3 utility rate or some sort of bonus incentive.

4 Certain mandatory features could also be  
5 required to be installed as part of the HERS  
6 rating. In other words, the house is rated at a  
7 certain level, but it's also found during the  
8 course of the evaluation that it doesn't have  
9 adequate ceiling insulation.

10 Maybe that could be the mandate, must  
11 bring up the ceiling insulation level, and then  
12 here's also your HERS score to do with what you  
13 wish -- to get an energy efficient mortgage, to go  
14 to a utility program, whatever. But you could  
15 require a mandated installation based on the  
16 results of a HERS evaluation.

17 MR. BARDSLEY: Lem Bardsley, Southern  
18 California Gas. Just a quantitative question.  
19 How many HERS auditors are registered in the state  
20 of California?

21 MS. BENNINGFIELD: Bill Pennington knows  
22 that answer. Do you, Tom?

23 MR. HAMILTON: CHEERS has just a little  
24 over 200 statewide.

25 MS. BENNINGFIELD: It's only going

1 to grow, because these raters are going to be more  
2 essential in the 2005 implementations, because  
3 there'll be a lot of verification required.

4 MR. BARDSLEY: Has there been any push  
5 to have the raters and the appraisers in the same  
6 bucket, with a dual skill set? As opposed, if you  
7 go way back to our very first chart of the morning  
8 you would have to have an appraisal for a refi,  
9 and then you'd have to have a HERS rating also.

10 Which are two separate costs, and two  
11 separate people, if you would, two separate  
12 reports, two separate areas. If you had that skill  
13 set combined that could lead to more cost-  
14 effective measures.

15 MS. BENNINGFIELD: Cross-training and  
16 cross-certification?

17 MR. BARDSLEY: I don't know how you  
18 could drive that.

19 MR. HAMILTON: Tom Hamilton. Yes, we  
20 have some raters that are appraisers, we have some  
21 that are home inspectors, some are installers, it  
22 runs the gamut. Appraisers, they do say that a  
23 little bit -- I think it's on form 70A, where they  
24 address energy efficiency real briefly.

25 But on residential they're using sort of

1 a market value approach, which doesn't factor in  
2 the energy savings.

3 Where on a multifamily the income  
4 approach is more applicable for a multifamily,  
5 where you would value the energy efficiency  
6 savings. So, yes, there is a lot of cross-  
7 training that does occur right now and certainly  
8 consolidating it to one person makes sense. Some  
9 do it, some don't. It's a matter of preference I  
10 think.

11 MR. BROOMHEAD: Cal Broomhead. I would  
12 think that we wouldn't want to peg any particular  
13 part of the industry and say "these are the people  
14 you have to be." You'd make the training  
15 available to anybody who wants it. Some real  
16 estate agents might decide why pass that cost on  
17 to somebody else. If it's easy enough I'll take  
18 it on myself and make an extra hundred bucks.  
19 Whoever wants to go into business, into doing  
20 this --

21 MR. HAMILTON: Yes, and it's even  
22 getting to the point where, you know, particularly  
23 with appraisers. Appraisers want a cookie cutter,  
24 a single family, they are not even showing up.  
25 It's basically just top underwriter or artificial

1 intelligence they're using, so they may not even  
2 go.

3           Also, home inspections aren't required  
4 in the state, and some firms don't support the  
5 view of home inspectors. So the rater may be the  
6 only person that ever shows up at the house, if it  
7 is required. But it's another variable to think  
8 about.

9           MR. BROOMHEAD: I thought most banks  
10 required it, not just a pest report.

11           MR. AHMED: Well, I do -- some of the  
12 appraisals that I have seen, the person just walks  
13 in and asks how many bedrooms there are, how many  
14 bathrooms, how many car garage, and that's the  
15 appraisal. Then they just walk out. They spend  
16 less than fifteen minutes in a home.

17           MR. BROOMHEAD: I've seen them do it in  
18 a minute and a half.

19           MR. AHMED: Exactly. But I would agree  
20 with Len that a good time to do it would be when  
21 the homeowner is about to sell the house and wants  
22 to know the value of the house, and at that point  
23 he or she needs to know what needs to be done in  
24 order to qualify for the sale.

25           In other words, put in more insulation

1 or whatever needs to be done. So I think in a way  
2 it's better if the appraiser and the rater, the  
3 HERS rater, is the same person. Or the realtor  
4 and the HERS rater is the same person. So the  
5 person knows where the problems are at, if I have  
6 to sell this house I have to spend \$3,000 before I  
7 can even sell it. So I think that would really  
8 be helpful.

9 MR. GUSTAVSON: Dale Gustavson, Cal-  
10 ACCA. I was wondering, just following up on that  
11 idea. I'm wondering if it doesn't become somewhat  
12 of a barrier though when you start talking about  
13 looking at the HVAC systems in a residence.

14 My last real estate agent was pretty  
15 darn aggressive, but I can't imagine them carting  
16 around duct work, and they certainly don't have  
17 the licensing or the training to slap gauges on  
18 the HVAC system, so --. Good idea, but maybe hard  
19 to milk. In a perfect world.

20 MR. AHMED: Well, what I meant was  
21 combine in the sense that the real estate agent  
22 could get the HERS rating if necessary, you know,  
23 to check the ducts and the attics and things like  
24 that.

25 MS. BENNINGFIELD: Is a contractor's

1 license required to be a HERS rater?

2 MR. HAMILTON: No, because our raters  
3 aren't allowed to install anything or sell  
4 anything, so you don't need a license.

5 MS. BENNINGFIELD: But they do apply  
6 gauges to equipment, and they do duct blasting.

7 MR. HAMILTON: Except for the  
8 refrigerant charge you have to be EPA certified.  
9 Most of them, you know, to do a duct test or a  
10 blower door or a flow hood, you don't need a  
11 license to do that. As long as they don't touch  
12 any of the equipment, removing it or anything like  
13 that.

14 MR. GUSTAVSON: Dale Gustavson, Cal-  
15 ACCA. Tom, pardon my ignorance on this, but is  
16 there any consistency across the 200 raters in  
17 terms of how many are using those kinds of  
18 diagnostics on the HVAC, or is it just a way  
19 they're differentiating one another right now?

20 MR. HAMILTON: The diagnostics are used  
21 more on new. At this point in time we do have  
22 some that will do diagnostics on existing. But  
23 the majority of it on new, because of the  
24 standards or the programs that are being run, like  
25 ComfortWise, they will do diagnostics.

1           But on existing it's more -- if they  
2   don't do diagnostics there's default settings in  
3   the software that will kick in for determining  
4   cost-effectiveness or energy savings.

5           MR. GUSTAVSON: So might there be an  
6   opportunity just in terms of what's required to  
7   become a rater, that the EPA certification might  
8   be added in order to then take advantage of some  
9   of these diagnostics that we have on the market at  
10   this time.

11           And I'm just thinking that might be a  
12   real easy way to change a whole bunch of people  
13   real fast.

14           MR. HAMILTON: I know there's three  
15   levels of the EPA certification. If you do a  
16   refrigerant charge, if you, again, tap the line,  
17   the refrigerant line. But to get that, again, I'm  
18   not sure. Some of our raters have it because  
19   they're HVAC contractors. They're C20's, and some  
20   have B licenses.

21           But it runs the gamut. At this point in  
22   time it hasn't been -- at least on new  
23   construction -- the refrigerant charge hasn't been  
24   a big selling point I guess. Most of them are  
25   doing tight ducts or better systems -- HVAC, SEER

1 12's, that type of thing.

2 MS. BENNINGFIELD: This question is for  
3 both of you. if we start looking at older homes  
4 with different kinds of installation and older  
5 equipment that's maybe not as easy to access as  
6 you see in new construction. Would that become  
7 more of an issue then, to have the proper -- to  
8 even maybe require a C20 license?

9 MR. HAMILTON: No, because I don't have  
10 the equipment itself, if you go into a home --  
11 I'll just use my house. It's built in the 60's,  
12 and the equipment is there since the 60's. Yes,  
13 you can look at the label. Once you look at the  
14 label that's on the equipment you then have to go  
15 to ARI, I think it is, to look up what the  
16 equipment is, the SEER rating and so on.

17 And then to do a tight duct test you  
18 just have to see all the registers and put on the  
19 system and test it. That's the extent of looking  
20 at the equipment.

21 You get extreme if you ever did  
22 something legislatively or regulatorily of, you  
23 know, every house sold must meet the Title 24 2005  
24 new construction standards, that you have to have  
25 a SEER 10 with a TXV, or SEER 12. You know,

1     that's -- but looking at the equipment and testing  
2     it is fairly easy.

3             MR. GUSTAVSON:   Let me respond, Tom.  
4     First of all, quick retort, I'm not sure it's as  
5     easy as it's been portrayed to investigate how  
6     well an air conditioner or air conditioner systems  
7     are working.  In fact, the industry I represent is  
8     plagued with poor performance in that area, even  
9     though the expertise exists.

10            There are other barriers in the  
11    marketplace that are preventing good work.  And we  
12    don't need to go through the list, but there's a  
13    lot of shoddy work going on.  So, but in this  
14    point brought up earlier, I think it was something  
15    Randel said before going to lunch -- it may be  
16    possible, instead of deciding that a 10 SEER unit  
17    must be replaced with a 12 or 14 or something that  
18    isn't going to be palatable, that we might be able  
19    to require that a 10 SEER unit is operating at 90  
20    percent of its capacity or efficiency.

21            And the ability to do those measurements  
22    exists now.  And the ability to move those units  
23    from 65 percent efficiency and capacity to 95 or  
24    100 exists now.  And it's simply by putting a --  
25    let's call it a supergauge connected to a computer

1     that says "here it is, and you change the charge,  
2     and you clean the coil, and you'll increase the  
3     efficiency by this much."

4             And then you do the work and verify that  
5     it's done. All of that is doable now. And so we  
6     can at least get the ones out there up to a  
7     particular standard, if replacing them is not  
8     politically ballottable.

9             MS. GLASSEL: What does something like  
10    that cost? Are you saying this would go with the  
11    HERS rating?

12            MR. GUSTAVSON: Yes, I see an  
13    opportunity with the HERS rating, I see an  
14    opportunity --

15            MS. GLASSEL: How much does something  
16    like that cost?

17            MR. GUSTAVSON: About \$2,000 per each  
18    technician.

19            MS. GLASSEL: \$2,000? This is cost-  
20    prohibitive.

21            MR. GUSTAVSON: Well, there are a couple  
22    of different models, but there's only one where  
23    the energy efficiency and capacity is determined,  
24    and that's a particular technology and it --

25            MR. RIEDEL: Dale, excuse me, this is

1 Randel. She was asking how much does it cost the  
2 homeowner to have that test done?

3 MR. GUSTAVSON: At this point in time no  
4 more than it would to do a regular maintenance  
5 kind of inspection on a home.

6 MS. GLASSEL: So are you saying that  
7 they would have a HERS rating that costs the buyer  
8 \$200, that's about the going rate, plus --

9 MR. GUSTAVSON: Add \$50 and you have an  
10 accurate reading on the refrigeration cycle of the  
11 air conditioning system.

12 MS. GLASSEL: Who's going to come out  
13 for \$50 if the HERS rater doesn't --

14 MR. GUSTAVSON: If the HERS rater has  
15 the equipment the HERS rater could do it for that  
16 incremental cost easily.

17 MS. GLASSEL: Okay, I'm with you now.

18 MR. GUSTAVSON: That's, there's  
19 certainly an opportunity for us to be talking  
20 about this.

21 MR. GARCIA: I have a comment, because  
22 this is a discussion tht Bruce and Randel and I  
23 have had over time, and it has to do with what  
24 Bobbi was getting at. What's the incremental  
25 value of perfecting that information? I mean, we

1     could probably get it four decimal places out  
2     there if we were willing to spend, I don't know,  
3     \$5,000.

4             But if the savings that you're going to  
5     get is going to be \$528 a year, you really have to  
6     think about it as to what is the value of that,  
7     and are we really accomplishing anything for the  
8     public good.

9             MS. BENNINGFIELD:   Yes, Mike.

10            MR. HODGSON:   We're talking about HERS  
11     in the retrofit market.  And my understanding, and  
12     correct me if I'm wrong, the rulemaking for HERS  
13     for the existing market has not been completed, so  
14     we really need to do that first.

15            And I think that may be an opportunity  
16     to encourage the CEC to complete their HERS  
17     rulemaking by January 2004 -- you know, something  
18     realistic.  And then, you know, build on that.  
19     Because the HERS process is in the new  
20     construction market, it's working reasonably well  
21     there.

22            It's very cost-effective for the people  
23     who are using it properly, and it's a great  
24     building block.  It's an example of what to do,  
25     and what to do right.  And I think the Commission

1 agrees with that approach also. And I know the  
2 utilities agree with that approach because they've  
3 been sponsoring it for such a long time.

4 So when you say HERS infrastructure is  
5 already set up, I'm a little concerned that the  
6 actual final step of that HERS infrastructure,  
7 which is a rulemaking which gives us the authority  
8 and the quality control that people like Tom need  
9 to maintain his HERS raters, doesn't exist.

10 MS. BENNINGFIELD: Yes, you're right.

11 MR. HODGSON: And we need to close that  
12 loop, and we've been trying to do that for about  
13 seven years.

14 MS. BENNINGFIELD: Good point.

15 MR. QUINN: Mr. Chairman, if I may.  
16 Home energy ratings, and the information I gave  
17 you with respect to the java and the dec  
18 messaging, has to do with what we call in the  
19 control business the backbone systems.

20 If you have two backbone systems that  
21 are able to transmit the data, if you look at  
22 today's San Francisco paper it says "cable rates  
23 to rise." Now that's exactly what I was talking  
24 about in terms of how you're going to address any  
25 and all buildings no matter where they're located

1 in any given city, but in principle the largest  
2 110 cities in the entire United States.

3 This is the problem that's been  
4 addressed from a national design tool perspective,  
5 coming down to the regional and sub-regional  
6 perspective. In that context, the diagnostics  
7 have always been the charge that people like  
8 myself, that have been associated with the  
9 National Institute of Standards and Technology  
10 have always had to look at.

11 So in terms of the backbone of  
12 information, those two references in that magazine  
13 that I gave you were specifically addressed to how  
14 you're going to get that information from the  
15 front end of the system to the back end of the  
16 system.

17 The diagnostics that Mr. Hamilton here  
18 is referring to is one of the reasons I wouldn't  
19 become associated with the raters in this  
20 particular state, even though I think I have those  
21 qualifications.

22 But the particulars are that the  
23 standards still are not established for  
24 functionality and the measurement and the  
25 establishment of those backbone systems. We are

1 in this interim period of time, and you're trying  
2 to address how you're going to fill in or backfill  
3 the very situation during this interim time period  
4 between now and the beginning of fiscal 2006 and  
5 07.

6 Dr. Rosenfeld asked me the same  
7 question. We have resolved that question in San  
8 Diego. When the California Energy Commission went  
9 down there, I think it was September 1996, and put  
10 on the PIER program for that very purpose, was to  
11 educate the people of San Diego and the business  
12 people precisely what Title 1 was all about, what  
13 diagnostics was going to be required, and what the  
14 backbone system was going to be when Microsoft and  
15 IBM brought out the messaging system in the  
16 backbone to transmit between the bolt and the  
17 cities.

18 I can tell you standing here today the  
19 work I have involved in. We have over five  
20 million buildings in Italy that are being operated  
21 from Sunnyvale, California. Now how come we can  
22 do that and we can't do it in Sacramento?

23 MR. CENICEROS: Thank you, Mr. Quinn.

24 MR. QUINN: This is what fascinates me,  
25 is the vacuum that exists here in terms of

1 technology.

2 MS. BENNINGFIELD: I think to solve some  
3 of these HERS issues, including getting going  
4 again on the rulemaking, later on we'll be looking  
5 at forming working groups so that we can schedule  
6 some of these issues and work through them.

7 We need to do a little bit more work in  
8 order for this process to be viable, but I think  
9 it's close and its worth looking further into.  
10 Are there any other on residential? Yes?

11 MS. BACHRACH: Devra Bachrach, NRDC.  
12 I'm wondering what discussions you've started  
13 having, perhaps with the real estate industry, on  
14 this topic.

15 MS. BENNINGFIELD: We're trying to get  
16 them to the table. We have sort of semi-  
17 accomplished that today. But what we want to do  
18 with these working groups is identify the key  
19 stakeholders that will help formulate the process  
20 that works.

21 So other than the feedback of they don't  
22 want it, it takes time and it hurts the sale, we  
23 haven't had any formal discussion. Randel has  
24 actually had more experience than we have on it.  
25 Do you want to just briefly share some

1 information?

2 MR. RIEDEL: Yes, I can just briefly  
3 give you some information. A number of years ago,  
4 when we were developing the energy efficient  
5 mortgage programs, under a legislative mandate, we  
6 did contact the California Association of  
7 Realtors, and they participated and assisted us in  
8 developing a teaching tool that was given to their  
9 members, that not only talked about energy  
10 efficient mortgages, but home energy rating  
11 systems.

12 One of the lead individuals there also  
13 helped to put in their standard deposit and  
14 receipt form a specific terminology in their  
15 disclosure that said, when made available that  
16 they were to supply the prospective homebuyer with  
17 a pamphlet that described what home energy rating  
18 systems were, and how it could benefit them.

19 I just recently spoke with the  
20 governmental liaisons who are located here in  
21 Sacramento with CAR, and told them about the  
22 workshop and AB 549, and directed them to your  
23 website, and was told that they would participate.

24 So, I don't see them here today, but I  
25 don't take that as necessarily that they're not

1 interested in participating. So one of the things  
2 I do want to do is encourage them to become a  
3 member of one of our working groups. So I hope  
4 that didn't go into too much detail about  
5 answering your question.

6 But at least we know CAR has a stated  
7 interest in participating.

8 MS. GLASSEL: The average life of a real  
9 estate agent is probably two years, and that  
10 probably goes for the lending community too.  
11 We've been asking the realtor and the lender to be  
12 the salesperson for energy efficiency.

13 I was a realtor for 15 years, so I feel  
14 that I can say this. They're not interested.  
15 Their purchase order now is little check boxes,  
16 check this, check that, sign your name. And oh my  
17 God the poor little babies are only collecting 6  
18 percent commission on \$300,000 homes, you know.

19 We can no longer ask them to be our  
20 salespeople for energy efficiency. They've become  
21 a computer industry. And I see energy  
22 improvements, how are we going to allow these  
23 homeowners to finance these energy improvements?  
24 Where's the money coming from? Go ahead, Randel.

25 MR. RIEDEL: I'm sorry to interrupt you,

1 Bobbi. This is Randel again. The main reason why  
2 we're seeking to have an open dialogue with them  
3 is because they might be one of the particular  
4 parties that would put some objections to what it  
5 is we're trying to do, so we're not necessarily  
6 soliciting them to help us in regards to sell or  
7 promote the program as we are in regards to  
8 getting their understanding and/or support of what  
9 we're trying to do.

10 MS. GLASSEL: Randel, one of the  
11 suggestions I made -- and I don't know if it's a  
12 correct one, but it's as good a place to start as  
13 any place. Let's get this on the purchase order,  
14 or as an addendum to the purchase order, that says  
15 "Mr. Buyer, you have an opportunity to look into  
16 energy improvements."

17 That way that buyer knows that it's  
18 there. That's all we're asking is just let that  
19 Mr. Buyer know that this is available, and we do  
20 need CAR for that.

21 MR. RIEDEL: We really appreciate the  
22 written comments that you also supplied us, that  
23 helped us a lot.

24 MS. GLASSEL: That took my whole  
25 brainpower, Randel, that just filled me with --

1           MR. RIEDEL: That type of response we  
2 really appreciate, so thank you Bobbi for that.

3           MR. QUINN: May I have one more minute  
4 please.? Very critical. I'd like to answer this  
5 particular question. Everybody's asking about the  
6 cost. Every cost is unique, every cost is  
7 customized, without exception. Let's get that  
8 straight.

9           If all of you will take the time to go  
10 to Reno on the 14th and 15th of next month, less  
11 than 30 days from today, in four dimensions of old  
12 buildings and new buildings a very specific  
13 question as follows will be answered. Fire  
14 safety, life safety, electrical safety, and  
15 building safety.

16           Now all the questions you've asked since  
17 you arrived here at 10:00 this morning, from the  
18 national fire code, from the national building  
19 construction and safety code, those two days in  
20 Reno will be answered for you. The related cost  
21 will be answered for you.

22           Now that was signed off by the National  
23 Institute of Standards on July 29th of this year.  
24 Without exception, it covers all new buildings and  
25 old buildings. Now that is under the national

1 fire protection code 5000.

2 I was in the competing code of the  
3 international code council on an international  
4 basis, which has now been superseded on the  
5 national basis. So I'm inviting each of you,  
6 please, please go to Reno on the 14th and 15th of  
7 November, and your questions will be answered.

8 MR. RIEDEL: Would you send us that  
9 information in an e-mail form so that we can  
10 provide it to others, please?

11 MR. QUINN: I am no longer attached to  
12 the web. I'm totally disgusted with this  
13 insidious game that's being played. So that's my  
14 answer. I do not communicate with the outside  
15 world, except under these conditions. Thank you.

16 MS. HUSSEY: Mr. Quinn, if you have that  
17 information I'll be glad to take it and I'll  
18 provide it to them as needed. Thank you.

19 MS. BENNINGFIELD: Okay, Rochelle and  
20 Tom, yes Tom?

21 MR. HAMILTON: Tom Hamilton. I think  
22 last year -- you'll have to check me on the bill  
23 number, but I believe it was AB 1574, which was  
24 the disclosure for home inspectors, just to see  
25 how that could fit into the entire process, to

1 expand that.

2 Because originally that bill had  
3 language about requiring HERS verifications or  
4 ratings in it. So whoever the assemblyman or  
5 state senator that carried it, maybe somebody can  
6 talk to them again.

7 MS. BENNINGFIELD: Okay, thank you.

8 MR. CENICEROS: And maybe provide some  
9 statutory basis to build from, and demark with  
10 some of the things people have been proposing  
11 here.

12 MS. GLASSEL: Lynn said something about  
13 some type of mandatory improvements. If the EEM  
14 funds were used for this I don't see how we can  
15 make it mandatory for them to do any one thing.  
16 These people were paying for this, this is their  
17 funds. So we couldn't ask them and say you have  
18 to bring your insulation up or whatever.

19 So it would just be what Jimmy Carter  
20 mandated many years ago, and the program works.  
21 The buyers are very sophisticated. I've had many  
22 people say "oh, I want new windows", that's what  
23 they have their hearts set on, but turn right  
24 around and say "I see the energy savings is in  
25 insulation. I really want new windows, but I see

1     this is where I'm going to save my money."

2                 MS. BENNINGFIELD:   So you're saying,  
3     because you're offering the incentive of  
4     additional leveraging because of the mortgage,  
5     their choice has to be involved.  They have to  
6     have a choice at all levels.

7                 MS. GLASSEL:   Well, yes, they're paying  
8     for it.  Nobody's giving them anything, so that's  
9     their money.

10                MR. BROOMHEAD:   Cal Broomhead.  That  
11     also gives you the flexibility of peculiar  
12     buildings.  And in the residential stock there are  
13     a lot of really peculiar buildings out there.

14                MS. GLASSEL:   Well, this program is  
15     nationwide, and I don't know if we want to go in  
16     and start changing it and tweaking it.  It's  
17     worked for almost 20 years now.  And this is just  
18     my little program.  I don't know what you guys  
19     could do with other things, but this is just what  
20     I'm saying about this one little small piece of  
21     pie.  It could save us kazillions of dollars.

22                MR. GUSTAVSON:   Dale Gustavson of Cal-  
23     ACCA.  Just a couple of quick comments.  As Bobbi  
24     was talking I wrote down energy efficiency bill of  
25     rights.  Some of this may be marketing and

1     wording.

2                 We're talking about rating systems and  
3     of what value is that. And perhaps there's a way  
4     to codify what that checklist is. Maybe it's  
5     something a lot more important to the homeowner  
6     than it is to the salesperson.

7                 The second comment is, I think it's sort  
8     of an overarching barrier, and --

9                 COMMISSIONER ROSENFELD: Excuse me,  
10    Dale, I'm going to interrupt you for 30 seconds,  
11    if I may. I have a 2:15 date, and I did say I  
12    would bring down and read off a couple of  
13    websites. So I'll take 30 seconds to do that.

14                There are two volumes from -- courtesy  
15    of PG&E -- who sort of did the same support job  
16    for standards development which you folks did.  
17    The web address is [www.calmat.org](http://www.calmat.org). And one of  
18    these two volume reports is called Residential,  
19    and has gas as well as electric measures.

20                One of the two volume reports is  
21    commercial, and I think it only has electric.

22                MR. BROOMHEAD: Could you read the title  
23    of the report?

24                COMMISSIONER ROSENFELD: Yes. The  
25    residential one is called California Statewide

1 Residential Sector Energy Efficiency Potential  
2 Study. I don't think you'll have any trouble  
3 finding them.

4 MS. AUSTIN: And it's also, the citation  
5 is also in our markets and potential report, if  
6 you want to look at it.

7 COMMISSIONER ROSENFELD: Oh, good, okay.  
8 And then, if you look in these reports you'll find  
9 conservation supply curves and tables, and the  
10 nice thing is if you look at the table they order  
11 by cheapest thing first.

12 So the tables are a little bit  
13 discouraging at first, because at first you think  
14 they have 40 issues or something, but there are  
15 only about ten or 15 that are really interesting,  
16 where the cost of conserving electricity is a few  
17 cents a kilowatt hour, and you want to go for  
18 them.

19 So I think they're quite useful. And  
20 then the summary document is called California's  
21 Secret Energy Surplus, and that is on the energy  
22 foundation website, which is [www.ef.org](http://www.ef.org). And I'm  
23 sorry, I don't have the next key word, but I did  
24 manage to find it recently, it can be done. Okay,  
25 thank you.

1           MS. BENNINGFIELD: Thank you,  
2 Commissioner Rosenfeld. Final comment. What  
3 Bobbi and Tom, I think it was both of you -- no,  
4 it was just Bobbi. There is an overarching issue.  
5 When you say the agents aren't going to help them  
6 and they're becoming a checklist industry.

7           It's fascinating to me, and I think if  
8 we could find ways to get through this issue  
9 through code it would make me happy. And that is  
10 that it strikes me as very odd that someone can  
11 make six percent.

12           In southern California, where I am, it's  
13 \$650 to \$750,000 for what really amounts to not  
14 very much work, and yet the people -- well, it's  
15 going to be a hard job making a living at it.  
16 But, as compared to the people that do the kind of  
17 work that we're talking about getting done.

18           It is simply not considered very, what's  
19 the word I'm looking for, it's not an elegant  
20 profession to be crawling around fixing holes in  
21 duct work. And it's not valued in dollars and  
22 cents in society. And how we can get to that, I  
23 keep asking that question. And it'll come up in  
24 the controls discussion as well.

25           The people, whether it's CHEERS raters

1 or people who look at HVAC systems and so forth,  
2 simply do not get paid the kinds of margins that,  
3 for instance, a real estate agent would get paid.

4 MR. BARDSLEY: Just in rebuttal, I  
5 wonder why they last only two years if they're  
6 making that kind of bucks.

7 MS. GLASSEL: That's all they need to  
8 make, and then they can retire.

9 MR. DUDLEY: Paul Dudley with Bristolite  
10 Skylights. That was a very practical observation,  
11 and that's the only way things work in business,  
12 you've got to be practical.

13 I just wanted to emphasize the fact that  
14 if this isn't worked out with the real estate  
15 people, this isn't a speed bump in their business,  
16 this is a major, major wall. You can't stop  
17 sales. It's just not going to work.

18 However, there's ways around that too.  
19 I know I just recently, not recently, ten years  
20 ago, I bought a house that was almost 100 years  
21 old, and received a loan that I think was  
22 something called a 203K, or something like that,  
23 an FHA thing.

24 MS. GLASSEL: 203KB, yes.

25 MR. DUDLEY: Yes, they actually loaned

1 me funds to fix up the house and it was put on a  
2 schedule like a construction loan. It actually  
3 was a part of my major mortgage. So maybe that's  
4 something that you could look through with them.

5 First of all, it should be, you know,  
6 you do an inspection and here's what the house  
7 needs to bring it up to what we need. And then  
8 who pays for that can be a negotiation of the sale  
9 of the house.

10 If it happens to be the previous owner  
11 of the house, potentially funds could be withheld  
12 until it was completed, but the sale of the house  
13 goes through.

14 And if it was something that was going  
15 to go on the part of the owner then it could be  
16 financed in the mortgage. And he doesn't receive  
17 those funds until it's checked off and it's all  
18 secured by a lien on his house, so if he doesn't  
19 do it he has a lien on his house, those kinds of  
20 people.

21 But I think if you don't really  
22 coordinate with those people, if they were sitting  
23 in this room right here today, they'd be going  
24 ballistic. It is a very hard job, I'm not trying  
25 to do it, not for six percent, not for any money

1 -- and/or be an air conditioning contractor. So  
2 anyway, just a comment.

3 MS. BENNINGFIELD: Cal, you had a  
4 comment?

5 MR. BROOMHEAD: Yes, I was sitting here  
6 thinking, I think it was when you mentioned the  
7 disclosure. I remember I had to sign off about  
8 half a dozen things. Yes, I got the pamphlet on  
9 lead and a whole bunch of things.

10 How can we inject, or at what point do  
11 we try and get education or education of the  
12 consumer into this, because I think that's where  
13 programmable thermostats fall down.

14 I mean, I just happened to be in a  
15 city's fire departments and installed programmable  
16 thermostats. And I finally went to one that was  
17 installed, and it was unintelligible how to  
18 operate them, and the guys at the station had just  
19 pulled the wires out and bypassed them.

20 They were just touching the wires  
21 together, and later they installed the switch.  
22 And I think that's one of the biggest issues is  
23 just training. And that whole education concept  
24 is an important part, and is there an opportunity  
25 here for some education.

1           And I'd hate to see it boiled down to  
2 just one more thing on the checklist that yes,  
3 they signed and got the pamphlet.

4           But it could easily boil down to that.  
5 I've seen the education components degenerate to  
6 that really quickly in the past. And I --

7           MS. GLASSEL: Randel, how much did PG&E  
8 spend for educating realtors with Staples-  
9 Hutchersen?

10          MR. RIEDEL: Lots.

11          MS. GLASSEL: Bunches. It has to be  
12 made, the buyer has to be made aware. That's all  
13 we're asking, that this opportunity is available.  
14 Not mandatory, but that it's made available to  
15 them. And the only way it's ever going to happen  
16 is if it's in writing.

17          MR. BROOMHEAD: In a checked box.

18          MS. GLASSEL: In a checked box, just  
19 like home warranty, home inspection, whatever.

20          MS. BENNINGFIELD: Okay, we need to wrap  
21 up this issue, but go ahead Mike.

22          MR. HODGSON: You could test how  
23 successful that was. Because I know of the  
24 Colorado Build Green Program, and they had an  
25 interesting logo -- something reminds me of a

1 frog, and I don't remember what it was, but they  
2 started doing, probably 11 or 12 years ago, had  
3 the Department of Real Estate there, as a  
4 requirement, adopt a notification that energy  
5 efficient mortgages were available.

6 And the homebuyer had to sign off. I  
7 don't know if there was a rating system there --  
8 do you know, Tom, if there was? I think it was  
9 like a two or three star program, it was pretty  
10 basis.

11 But their level of lending on energy  
12 measures went up, but I haven't really followed up  
13 on it. So it may be something to look into, did  
14 the Colorado housing finance, CHAFA -- what we  
15 would consider CHAFA, I don't know what they would  
16 call it.

17 I don't know if it still exists. It was  
18 one of the circuits that made it to the speaking  
19 things about five or six years ago.

20 MS. GLASSEL: One thing, Mike.  
21 California probably has more service companies  
22 than any state. We are innovators here. Other  
23 states -- in fact, I'm going to be a presenter at  
24 the resident energy conference in March, and I'm  
25 presenting how to become an energy efficient

1 mortgage service company.

2 And I've got a lot of interest in this.

3 They're seeing the value. How long ago was

4 Colorado, ten years?

5 MR. HODGSON: Ten or 12.

6 MS. GLASSEL: Ten or 12 years ago we  
7 didn't have the energy crunch that we've got now.

8 This is frontline news now, and the consumer is  
9 really seeing the necessity for this.

10 MS. BENNINGFIELD: Okay, thank you.  
11 Let's move on to commissioning, unless there's any  
12 final comments? All right, retrocommissioning.

13 It's -- retrocommissioning is a look at  
14 systems performance within a building, and the  
15 energy savings potential is huge, because we've  
16 found that, even in new construction a lot of  
17 times, the systems don't perform as designed when  
18 they're first put in, so as they age it  
19 progressively declines, it can be presumed. So  
20 there's quite a bit of savings potential.

21 The sales trigger is appropriate, but  
22 also the time of lease for commercial could be  
23 appropriate as well, because there's a lot of  
24 turnover in leasing and each occupant has unique  
25 needs. And each occupant may need to alter the

1 HVAC system or the lighting system to suit those  
2 needs.

3 We think that there's a large potential  
4 for expanding what is considered commissioning.  
5 And we're starting discussions now with the  
6 California Commissioning Collaborative to look at  
7 how their processes could feed into our  
8 recommendations.

9 So is there anybody here -- well, Tony,  
10 you're from, you're a representative of the  
11 California Commission Collaborative. Is there  
12 anybody else here? And Dale, too.

13 So I'd like to hear from you two about  
14 what you think it might take to use the tool of  
15 commissioning in a mandated sense to help save  
16 energy in existing buildings.

17 I mean, you've already talked a bit  
18 about how there's proven technologies out there  
19 that can improve the performance and optimize the  
20 performance of systems. Can you elaborate on that  
21 a little bit? Under what conditions, so what's  
22 the cost. What would you suggest as a recommended  
23 trigger?

24 MR. GUSTAVSON: Dale Gustavson, Cal-  
25 ACCA. First off let's make sure, I'm going to

1 stick primarily to HVAC and controls, because  
2 that's what I know most about. I actually think  
3 the 2005 standards begin to get at the issue of  
4 new installation of HVAC or replacement of  
5 commercial HVAC.

6 Because it's going to require  
7 certification of the insulation and in fact the  
8 systems is working. So I think there's a trigger  
9 there. I would probably go -- I haven't thought  
10 beyond, I haven't figured any trigger points that  
11 I can fathom as being palatable on the actual  
12 maintenance side of existing buildings. If I come  
13 up with it I'll let you know.

14 MS. BENNINGFIELD: You say there's a big  
15 problem with economizer operation. Do you think  
16 it's viable to say when you lease the building, if  
17 there is an economizer present, that it needs to  
18 be tested or recommissioned or, you know, on that  
19 simple level is that something that you think  
20 would be viable and acceptable?

21 MR. GUSTAVSON: I think in that case  
22 you've got the same issue you do with renting of a  
23 residential piece of property. The challenge  
24 would be to make sure the owner of the building  
25 was doing the work prior to leasing it, so the

1 same strategy as we talked about earlier.

2 Perhaps, in order to be leasable, then  
3 the economizers must be working properly. And  
4 maybe that connects to what we were talking about  
5 earlier with the utility trigger.

6 I'm not the most technical person in our  
7 association, but I'm hearing both at the street  
8 level and on that on some work being done in the  
9 northwest and some work being done in New York,  
10 that this diagnosing an economizer operation is  
11 not necessarily easy. And not necessarily  
12 inexpensive.

13 MS. BENNINGFIELD: Okay.

14 MR. GUSTAVSON: Replacing it is  
15 relatively inexpensive. But then there's a  
16 question of how much energy you're going to save  
17 incrementally, and you don't know that unless you  
18 know how the current one is operating.

19 MS. BENNINGFIELD: Thank you. Yes?

20 MR. AHMED: Yes, I have a question on  
21 this retrocommissioning. Are you envisioning some  
22 sort of a phase, on a calendar or every five years  
23 or a certain frequency of buildings, or only at  
24 the time of sale or lease?

25 MS. BENNINGFIELD: At this point we're

1     only considering at the time of sale or lease. So  
2     we certainly would want to consider maintenance,  
3     regularly scheduled maintenance. Somehow that  
4     might be more appropriate for a voluntary  
5     strategy.

6             But leases are typically three to five  
7     years. I know five years is quite a bit of time  
8     to wait between servicing. Three may be a little  
9     better. We really don't have a time frame in  
10    mind, because the types of occupancies, and the  
11    types of systems serving those occupancies are at  
12    such a wide range.

13            We'd have to look at the conditions from  
14    which we'd want to require. But at this point in  
15    time we're looking at are you leasing the  
16    building, has it been commissioned in the last two  
17    years, let's say, if no then it would need to be  
18    commissioned before it could be occupied.

19            MR. AHMED: The other side is that  
20    commissioning is a very general term, and how are  
21    you going to justify cost-effectiveness as far as  
22    commissioning. What will be the assumptions of  
23    what commissions of the buildings are, and what  
24    will they be in future is kind of hard to  
25    determine.

1           So it's going to be hard to justify  
2   commissioning every time there's a change of lease  
3   or occupancy. That's going to be hard. So it may  
4   be better if we have some sort of calendar thing  
5   that, once you start and then every five years you  
6   need to do one major recommissioning, or something  
7   like that.

8           Something to think about, because it's  
9   kind of hard to pin down. I mean, specific  
10   measures are easy, but re-commissioning, how much  
11   you'll save, nobody knows.

12           MS. BENNINGFIELD: Yes?

13           MR. BROOMHEAD: We had a commercial  
14   energy conservation ordinance in San Francisco,  
15   and essentially it died for over enforcement  
16   issues.

17           But one of the things they found in  
18   trying to make that ordinance work was that the  
19   large buildings -- the sale of lease of small  
20   buildings is probably a different picture -- but  
21   in very large buildings, of which we have a number  
22   of large buildings in San Francisco, as you  
23   probably all know, that they are never sold.

24           The shares are sold in the company that  
25   owns the building. So you may have turnover in

1 who owns the shares of that building, maybe a 100  
2 percent turnover over a period of a couple of  
3 years, but the actual ownership, the deed, remains  
4 in the hands of that holding company.

5 Now I believe that our tax office,  
6 because they're interested in transfer taxes and  
7 having those get paid, does some kind of watch of  
8 this, and they are able to get in and track that  
9 and still charge a portion of the tax to each one  
10 of those shares of transfer.

11 But I think that that would be dependent  
12 on the capacity of the local tax assessors office,  
13 to be able to is how sophisticated they are is how  
14 they're going to be able to get at that. So it's  
15 something worth investigating more.

16 Because we're going to try and  
17 reinstitute our dead commercial energy  
18 conservation ordinance. Hopefully in the next  
19 couple of months I'll be able to give you more  
20 information about what that actually looks like,  
21 because I wasn't involved in that originally,  
22 directly. And I don't have a lot of that  
23 information.

24 MS. BENNINGFIELD: Thank you. Could you  
25 tell us a little bit more about how it died over

1 enforcement issues originally?

2 MR. BROOMHEAD: You know, building  
3 inspectors -- well, I guess, a couple of things.  
4 One is that in order to have an effective  
5 ordinance means you've got political support, and  
6 that you've also been pretty good at doing what  
7 Randy was saying, about bringing in the real  
8 estate folks early, because you want to deal with  
9 the probable opposition, or neutralize your  
10 opposition.

11 And if that means changing what you're  
12 doing, so that it's more palatable to them, then  
13 that's the negotiation, you're entering into a  
14 negotiation process and it's a good, valuable  
15 thing to do.

16 But over time, if the political  
17 landscape changes and your support for doing the  
18 action in the first place erodes, because you  
19 don't have a constituency that's politically  
20 active and organized and forceful at that level,  
21 you always have the kind of unending and  
22 continuing self-interest of those who are in  
23 opposition, who will always be looking for  
24 opportunities to get rid of that.

25 And so you take that kind of ordinance

1 and place it in the hands of the enforcement, in  
2 the hands of a city department or a county  
3 department who's -- it's not their main mission,  
4 their main mission is something different.

5 And in this case it was the Department  
6 of Building Inspections. Their main mission is  
7 life safety issues, and they're much more  
8 interested in health, safety, fire, and making  
9 sure that the department isn't going to get sued  
10 for having inspected something that, you know,  
11 fell down a week later.

12 So their mission is not energy  
13 efficiency, and I think, over time, it just kind  
14 of went away. And they didn't pursue the  
15 enforcement of it as was needed, didn't devote the  
16 administrative time to send out the letters and  
17 check the databases and see that everything was  
18 done.

19 And therefore, over time, commercial  
20 real estate agents noticed that sometimes nothing  
21 happened. And after awhile it became standard  
22 practice to not do anything about it, and it  
23 became a dead ordinance.

24 So, again, as I get further detail on  
25 this I will forward it to you, but a lot of the

1 documentation of boxed up in the year 2000 and  
2 sent off into the mountain, so I'll be turning it  
3 all back gain and provide that to you.

4 MS. BENNINGFIELD: The mountains of San  
5 Francisco?

6 MR. BROOMHEAD: Right, Hetch Hetchy up  
7 by Warehouse. So, I think, those are the two  
8 issues the sort of ongoing constituency report  
9 that's needed to maintain something in the face of  
10 another constituency that has an opposing interest  
11 that will always be there.

12 And then -- which would be the  
13 commercial real estate agents and commercial  
14 property managers. And then the fact that you  
15 didn't have an agency who's central mission was to  
16 make sure that this mission was accomplished.

17 And those are kind of two structural  
18 issues that you're going to continue to have. I  
19 think maybe we won't have the political erosion of  
20 support over time that happened to the San  
21 Francisco SECO. I think maybe the future, the  
22 next decade or so, is going to be more solid.

23 And that once something passes that  
24 five-year mark it becomes institutionalized, and  
25 then everybody just looks at it as a matter of

1 course -- well, "this is what I've always been  
2 expected to do, well I think it's the law I have  
3 to do it this way, or I'm not doing my job." And  
4 then it happens as a matter of course, and you  
5 don't have to watch it so closely.

6 MR. QUINN: Chairman, may I comment to  
7 the gentleman from San Francisco? I made a  
8 presentation in San Francisco in July, 2002, on  
9 behalf of the construction specification  
10 Institute.

11 There was a published article in the  
12 ASHRAE Journal of June 2002, and I brought the  
13 subject to the attention of those members in San  
14 Francisco, to bring the attention to the building  
15 inspectors of San Francisco, as to how to  
16 neutralize building owners, as it applies to  
17 building specifications.

18 And if you will recall what I just  
19 alluded to a few moments ago in terms of building  
20 safety, electrical, etc., then if we could neuter  
21 lawyers and neuter politicians without being  
22 accused of discriminatory practices is just  
23 exactly what this gentleman is alluding to, it's  
24 that nobody knows what energy is or how to measure  
25 it, except for a few of us.

1           And when you allude to energy and how to  
2   measure it or how to control it, if you're doing  
3   it on a centralized basis or on a zonal basis,  
4   what is your design approach? You cannot correct  
5   the design approach of the first mistakes that  
6   were built into any building.

7           I thought we learned here many years ago  
8   what design approach and design intent was all  
9   about. That's exactly what the  
10   retrocommissioning, or new commissioning group is  
11   all about that is now being headed by PG&E.

12           I've had meetings with those people for  
13   four days in Palm Springs -- you were there, you  
14   weren't there -- my whole question is whether we  
15   call it neutering or neutralizing, we are here to  
16   institutionalize the constitution of the United  
17   States.

18           What are we doing otherwise? That's  
19   exactly what I'm trying to explain, is if you're  
20   interested go to Reno, and if you're not  
21   interested in how energy is delivered into a  
22   building then don't go.

23           It's called specifications and how to  
24   write a specification so you can neutralize an  
25   owner who doesn't know one damn thing about energy

1 to begin with. Thank you.

2 MS. BENNINGFIELD: Thank you.

3 MR. CENICEROS: Thank you. Cal?

4 MR. BROOMHEAD: I was going to try  
5 another technique, but I think -- an idea that I  
6 had written down earlier that came to me, was this  
7 whole issue about to take this whole approach  
8 about using Title 24 or expanding the  
9 authorization, is to make sure that we can improve  
10 our efforts to enforce the existing Title 24.

11 And that kind of ties in to issues with  
12 our own building department, is that's something,  
13 we need to develop a very collegial relationship  
14 with them to improve the enforcement of Title 24,  
15 at least discover what kinds of hitches that we're  
16 having in our own building department.

17 And I know that the Commission already  
18 has an effort at looking at this, and it's  
19 probably something that is going to need to be  
20 strengthened. Not just training, but kind of  
21 being on the ground and looking at each building  
22 and how it operates if you're going to understand  
23 how to make it more effective at the local level.

24 MS. BENNINGFIELD: Yes, I think PG&E is  
25 going to do that relatively soon, a short-term

1 project to look at -- yes, Mike?

2 MR. HODGSON: Just kind of a separate  
3 issue, going back a few comments on commissioning.  
4 It's my understanding now in the office and retail  
5 multi-tenant market that most leases -- and it's  
6 not the 2000 energy crisis, but before that -- are  
7 now requiring quarterly maintenance.

8 I know we've been exposed to that. We  
9 require it in some buildings that we own. So  
10 whether the owner pays for it or whether the  
11 tenant pays for it -- and being married to a  
12 commercial real estate broker, I get to review  
13 these from time to time -- that now is a fairly  
14 common part of a rental agreement, if you will,  
15 for --.

16 And I think it fits within your  
17 commissioning, so that may be an avenue for you to  
18 explore. Because it's really an ongoing  
19 maintenance issue. And you don't want them there  
20 once every five years or once every three years,  
21 you want them there every three months, cleaning  
22 the filters and doing this and that.

23 And it also is an issue that you could  
24 sell to BOMA, which is a very powerful group among  
25 building owners and maintenance groups. And they

1 basically are the ownership of the large  
2 buildings. And they are very cost-conscious  
3 folks. And this is a durability and longevity  
4 issue. Energy is probably fourth or fifth in  
5 line, but we want it from the energy standpoint.

6 So I think you can make that case and  
7 bring -- I know we're going to have fun bringing  
8 CAR into this discussion. I think you can get  
9 some allies like Cal is, let's build our support  
10 team here. I think you can bring BOMA into the  
11 picture, and have them, from a point of cost-  
12 effectiveness, support what you're talking about  
13 in commissioning.

14 MR. BROOMHEAD: Did you just say that  
15 building leases are now including --?

16 MR. HODGSON: The ones that I'm exposed  
17 to, which are usually multi-tenant leases. So  
18 there's not a single owner, it's maybe a retail  
19 strip, and there may be four owners or 25. Those  
20 usually -- in fact I have not seen one in the last  
21 four or five years that does not require quarterly  
22 maintenance of the mechanical equipment. And  
23 that's a maintenance contract in place at tie of  
24 lease signature.

25 MS. BENNINGFIELD: Okay, so the proof is

1 the signed maintenance agreement of the --.

2 MR. HODGSON: Right. And then you  
3 usually have someone -- BOMA is a big trade  
4 association of people who own buildings, right?  
5 And they will have, you know, there's a whole  
6 group out there like energy efficiency mortgage  
7 experts, there's a whole group of folks out there  
8 that manage buildings.

9 And one of the things that they do, and I  
10 agree it's a check the box thing, but they have to  
11 make sure this warranty or this maintenance  
12 agreement is in place, or else you're in violation  
13 of your lease. And if you're in a place you want  
14 to stay you tend not to want to be in violation of  
15 your lease.

16 MS. BENNINGFIELD: They're not required  
17 to forward reports quarterly, though they're  
18 required basically to take the liability that they  
19 will maintain the contract?

20 MR. HODGSON: They're required to make  
21 sure that they're in place.

22 MR. GUSTAVSON: If I could, Dale  
23 Gustavson, Cal-ACCA. I agree, more landlords who  
24 are in triple net situations are requiring their  
25 tenants to implement quarterly or at least semi-

1 annual maintenance.

2           The problem with it is, unless they  
3 control the company that's doing the work  
4 themselves-- and actually I happen to know of an  
5 example in Texas where the landlord picks the air  
6 conditioning contractor and the tenant pays for  
7 it. But I think that's really in the minority.

8           What tends to happen is the tenant will  
9 get a couple of bids, they're going to give the  
10 contract to the low bid contractor. And the  
11 problem with that is that most contractors doing  
12 maintenance in the marketplace today are actually  
13 losing money on the maintenance contract in order  
14 to be the one who gets the call when the unit  
15 breaks.

16           And most of those, what we  
17 affectionately call the low-bid scalawags in the  
18 industry, most of them are not interested at all  
19 in energy efficiency. I mean, that's the last  
20 thing on their mind. They barely care if it's  
21 working.

22           What they're looking for is the  
23 replacement, which is the big sale. There's an  
24 area there where just the requirements is not  
25 going to get us the reports that we need, or any

1 kind of validation that energy's being saved, or  
2 frankly that it's operating safely or that the  
3 life of the equipment has been extended.

4 MS. BENNINGFIELD: Thanks, good point.

5 MR. HODGSON: I can only speak from my  
6 experience. We own an office building, we have  
7 multi-tenants. We require it ourselves because we  
8 thought it was a good idea. Our experience has  
9 been very positive. Yes, things have broken, but  
10 we've been in the building for 11 years and we've  
11 lost, you know, an air conditioner here and there.

12 But every quarter they show up and they  
13 do their inspections. They're very professional.  
14 It happens to be a very large company throughout  
15 the state of California. And we're very  
16 satisfied, and I can see the value in doing that.

17 MS. BENNINGFIELD: Thank you. Okay, I  
18 think it's time to move on to controls. I notice  
19 we don't have a break built in to our afternoon  
20 session.

21 MR. CENICEROS: We're about halfway  
22 through the afternoon session now. Do people feel  
23 they would like a five minute break, or just come  
24 in and out as you need to?

25 MS. BENNINGFIELD: Okay, Tony, did you

1 have a brief comment?

2 MR. PIERCE: I was just going to add on  
3 retrocommissioning, the California Commission  
4 Collaborative met about two weeks ago, and we're  
5 wrestling with the problem. And I think it's  
6 analogous to what Mike Hodgson mentioned earlier  
7 with respect to the Commission getting a  
8 rulemaking for HERS system for existing buildings.

9 There's no current commissioning  
10 standard for existing buildings, so we're still  
11 working on that. And there's a lot of people, you  
12 know, is it retrocommissioning or re-commissioning  
13 or continuous commissioning.

14 So I think that, given the time line for  
15 any legislation that would follow on AB 549, I  
16 think we do consider it, continue to consider it,  
17 and what trigger is appropriate for it. I like  
18 the idea of looking at -- obviously we need to  
19 define commissioning, and the standard once we  
20 have one for existing buildings will let us do  
21 that -- but focusing on measures like the  
22 economizer that you mentioned, Lynn, I think is a  
23 good thing to do.

24 A measure or a compliance or a component  
25 of a compliance that has been well-documented as

1   having a poor track record, and early failure, and  
2   presents itself well for something that needs to  
3   be probably re-commissioned or continuous  
4   commissioned, which is a trademark term, so I have  
5   to give credit to the people at Texas A&M I guess.

6               But I think that we can continue to put  
7   those in, at least our report to the Commission,  
8   that some type of retrocommission activity for  
9   commercial buildings is appropriate. You know, we  
10   just need to define it a little further, and then  
11   see how it fits in.

12              MR. AHMED: I just wanted to add to what  
13   Tony just said. I think it's beyond just  
14   scheduled maintenance. Commissioning actually  
15   encompasses something much beyond the scheduled  
16   maintenance. So what Mike said is true, but you  
17   need to go beyond that.

18              MS. BENNINGFIELD: Okay. All right,  
19   let's go to controls, the topic of controls. The  
20   premise of having controls installed in a building  
21   is to turn off the energy when it's not needed.  
22   Using energy when it's not needed is wasteful.

23              The problem is, when and how energy is  
24   used involves personal decisions, and the  
25   motivation to optimize controls isn't always

1     there. And I'm talking in the broad sense right  
2     now of both HVAC and lighting controls, but it's  
3     especially true with lighting controls. There's  
4     been a lot of trouble with people bypassing their  
5     lighting controls, and you have the anecdote of  
6     people bypassing their thermostatic controls as  
7     well, so it happens a lot.

8             MR. BROOMHEAD: I've seen lighting  
9     controls bypassed with just a piece of masking  
10    tape.

11            MS. BENNINGFIELD: Yes, it's easy to do.  
12    Easy to install, easy to bypass. But optimizing  
13    the use of controls is sort of a tougher problem  
14    that we would like to look into further. And I  
15    can give you an example of a small office where  
16    you might put an occupancy sensor in.

17            Well, the behavior within that office is  
18    definitely going to dictate how much energy is  
19    going to be saved, and the standards now say 20  
20    minutes of vacancy time is when the control would  
21    turn off the lights.

22            But you might have a person where a five  
23    minute delay might be the optimum for that person.  
24    And they have no problem with the lights going off  
25    and then coming back on when they enter the room.

1           Some people don't like the lights  
2   automatically going on, they're not quite used to  
3   that. And in that case maybe the person never  
4   leaves for 20 minutes, so the occupancy sensor  
5   would never work, because they're in and out, and  
6   maybe a shorter time delay would work better for  
7   that person.

8           There are some types of lighting  
9   controls now, smarter controls, that kind of learn  
10   occupant behaviors. And we feel as though it's  
11   important to start thinking about how to  
12   standardize what the performance criteria for  
13   controls are, lighting controls and HVAC controls.  
14   How they talk to each other, how they talk to the  
15   utility, how they learn from the occupant to make  
16   them smarter so that they're not bypassed.

17           The ideal thing would be to have the  
18   controls be seamless to the occupant, so they  
19   would have to experience a discomfort or a lack of  
20   light in order to, you know, have the energy  
21   efficiency noticed. It would just be optimized  
22   automatically.

23           And there is a tie-in to the next topic,  
24   which is demand response programs and tariffs.  
25   Because a lot of these are looking at targeting

1 peak energy use, and controls are a very good  
2 vehicle for shaving that peak in buildings.

3 So we can discuss both at once if  
4 appropriate. If someone has an issue on controls  
5 in particular, though, let's talk about that now.  
6 And Dale has a plane to catch, so we'll give him  
7 the floor.

8 MR. GUSTAVSON: Dale Gustavson, Cal-  
9 ACCA. I'll preface my remark by saying that I  
10 thought for my 15 years in this industry that  
11 every bootleg should have a control system in it.  
12 On the other hand, some of the direction that  
13 you've suggested -- achieving some of these things  
14 have been extremely difficult. It's been like  
15 pulling teeth to get manufacturers on the same  
16 page.

17 And it's hard for me to even imagine,  
18 when you mention on page 36 of the report, the  
19 last paragraph, consistent user interfaces and  
20 consistent control algorithms. And that it may in  
21 fact be within current standards authority to  
22 require that, or maybe it's just that they be  
23 working correctly.

24 I've been scratching my head for that  
25 entire 15 years to determine how you can ever get

1 the manufacturers, who use different control  
2 algorithms and different user interfaces, to  
3 differentiate one another in the marketplace.

4 From a manufacturer perspective that is  
5 how they differentiate themselves, otherwise they  
6 become a distributor of vanilla, you know,  
7 whatever we've agreed to with our knowledge of the  
8 industry.

9 That being said, I think it probably can  
10 be worked on, and you've suggested convening a  
11 working group in this case. And my best  
12 suggestion on the working group is tht you  
13 definitely add controls distributors to the list.  
14 Way too often overlooked.

15 It depends on the manufacturer as to  
16 whether or not they use distribution, but there  
17 are some major manufacturers that have  
18 distributors. Those distributors play a very  
19 important role in terms of the sale process, the  
20 customer support afterwards.

21 And that you also add contractors.  
22 You've got the building operators here, but there  
23 are three groups of contractors I would say that  
24 are touching controls.

25 One would be the major controls

1 contractors, the second would be what I would  
2 describe as independent controls companies that  
3 specialize in controls, and that's all they do.  
4 And then there are mechanical contractors, some  
5 electrical but primarily mechanical contractors,  
6 that have their own control groups.

7           And all three of those entities and the  
8 distributors would have completely different  
9 perspectives on how to go about getting this done,  
10 and that's been one of the barriers. So to have  
11 all those folks represented in the working groups  
12 may seem like a lot, but I don't think so. I  
13 think it's absolutely critical. They all  
14 interface with one another in the marketplace.

15           MS. BENNINGFIELD: Is there a way to  
16 bypass that problem of individuality by just  
17 having the most basic performance specification,  
18 you know, the controls shall be able to do A, B,  
19 and C. And is there some level of agreement that  
20 could be achieved amongst the different contracts?

21           MR. GUSTAVSON: I believe that already  
22 exists. Now, backing up to the top of page 36, it  
23 says "control systems could also be designed to  
24 include fault detection equipment with warnings  
25 and self-correction."

1           And I couldn't agree more, and what  
2 might be characterized as the final phase of the  
3 PIER projects that are wrapping up now there is in  
4 fact a project that is looking at adding the fault  
5 detection diagnostics to control systems, and the  
6 violability of doing that.

7           In fact, that fault detection, some of  
8 the fault detection algorithms that are being  
9 looked at are the very same ones that are used in  
10 the portable diagnostics that I've been talking  
11 about that measures the capacity and efficiency of  
12 a unitary system.

13           So there may be some opportunities to  
14 require some diagnostics algorithms that go a  
15 little further than the control algorithms. But I  
16 think it's pretty dangerous looking at the control  
17 algorithms, because you might get Johnson Control  
18 saying "no, our algorithm is better." And you're  
19 going to get Honeywell saying "no, our algorithm  
20 is better." And you're not going to settle that  
21 with code.

22           But something on the fault detection  
23 diagnostics that is not yet owned by that  
24 industry, there may be some opportunities to push  
25 it along, I agree completely. In fact I'm pretty

1 excited about it.

2 MS. BENNINGFIELD: Good. Thanks. Any  
3 other comments on controls?

4 MR. PIERCE: I have a comment and sort  
5 of a question. Tony Pierce, SCE. There are  
6 products coming to market, both res and non-res,  
7 that would allow -- and this leads to the demand  
8 response controls that Len mentioned as a tie-in  
9 with uses of controls.

10 There are products coming to market that  
11 would allowed the utility, for example, to send a  
12 signal and request a load reduction at the  
13 customer site. And they're not proprietary,  
14 universal in the sense that it's not brand-  
15 specific or it doesn't have to speak a specific  
16 brand language.

17 Of the folks here, I'm curious, is there  
18 any reaction to -- going back to the topic of AB  
19 549 -- if we were to require that, or if at a  
20 certain trigger event that those types of controls  
21 be installed? I'm curious to know if anyone has a  
22 reaction to that?

23 MR. HODGSON: Tony, we have that as part  
24 of some of the development that's being done right  
25 now. So in some areas that are, you know, load

1     restrained, or in some experimental areas with  
2     some utilities, mostly muni's, they are requiring  
3     that load controls be installed in a large-scale  
4     subdivisions, something like 800 to 1,200 units,  
5     you know, multiple builders.

6             MS. BENNINGFIELD:  Are you talking about  
7     radio control?  No, okay.

8             MR. HODGSON:  Line load.  Line signal to  
9     the compressor and then to the --

10            MR. PIERCE:  Is that the builder and the  
11     municipality?  I mean, I'm looking at something  
12     that goes broader than that.

13            MR. HODGSON:  No, it's the utility  
14     request.  We're working with the builder, which I  
15     think is the interesting -- it's a demand on the  
16     utility side.  "If you want a meter you're going  
17     to do this."  And it's due to some constraints  
18     that they have, they have identified areas that  
19     they need to be very, very careful of.

20            MR. CENICEROS:  Mike, I assume that the  
21     homeowner has the option to enlist in a program  
22     that actually utilizes those control devices?

23            MR. HODGSON:  Bruce, I don't think  
24     there's any option, I think they're there.

25            MR. CENICEROS:  The devices are, but --

1 MR. HODGSON: And there is no opt out.

2 MR. CENICEROS: Interesting, okay.

3 MR. PIERCE: So that's from new  
4 construction?

5 MR. HODGSON: It's actually a, it's not  
6 a requirement, it's a tentative map approval  
7 requirement.

8 MR. CENICEROS: Really?

9 MR. HODGSON: Yes, there are some very  
10 specific areas that have popped up that are load  
11 constrained. And this is an option that they're  
12 trying.

13 MR. PIERCE: But going back to, I think  
14 Cal's question, is that new construction?

15 MR. HODGSON: Yes, it's new  
16 construction, I'm sorry.

17 MR. PIERCE: So if we were to, if out of  
18 this AB 549 study and effort, if some  
19 recommendation to the Legislature was to go  
20 forward saying that, you know, this should be a  
21 mandatory measure at trigger event X that these  
22 controls be retrofit in existing building stock,  
23 you think that's viable then, based on your  
24 experience with the new construction?

25 MR. HODGSON: I don't know the

1 electronics of how --

2 MR. PIERCE: Not getting into technical  
3 details.

4 MR. HODGSON: Do I think it's viable?

5 No, I think once the homeowner's there, it's  
6 there. I think you'd have them all sorts of  
7 property right issues, that when you're in a  
8 tentative map approval you don't have. In fact,  
9 building codes don't even at that time apply.

10 So it's after tentative map approval,  
11 when you go to final map, then codes take over.  
12 So as a condition of approval, everyone who buys  
13 in that parcel must acknowledge those  
14 requirements.

15 So I think that's where you have them.  
16 It's a master plan concept. I don't think going  
17 backwards, Tony, you'd have that ability to do  
18 that.

19 MR. GUSTAVSON: Are you talking about  
20 residential, or commercial also?

21 MR. PIERCE: Both. The technology is  
22 there, and there's pilot projects, there's new  
23 projects.

24 MR. GUSTAVSON: And are you suggesting  
25 that it might be possible to install algorithms in

1 existing controls systems, to retrofit them to do  
2 this, or does this, it would have to be in a  
3 mandate that any control systems installed from  
4 this point forward include the capabilities?

5 MR. PIERCE: Well, I'll respond specific  
6 to, say, commercial buildings. There are devices  
7 coming to market that would be installed in  
8 series, between the meter and the control system,  
9 that would receive a signal from a utility, and  
10 alter a signal to an EMS, for instance, that would  
11 say, if you have a demand reduction algorithm  
12 within the program it would alter the input  
13 signal.

14 So that's one technical description of  
15 why it wouldn't have to speak Brand X language.

16 MR. HODGSON: Tony, to respond, I'm not  
17 against it, I'm just saying there's other hurdles  
18 there.

19 However, we were talking a little bit,  
20 we just barely scratched the surface of possibly  
21 utility rate structures, so you may have a  
22 commercial rate, and as an incentive to go to this  
23 type of system you may change that commercial rate  
24 structure for that owner/tenant. And that may be  
25 an incentive to do that, rather than saying

1 "you're going to do it."

2 Because once you do that I think you're  
3 going to have a different issue with regards to  
4 what are the rights of the existing ownership and  
5 how did they buy the property and, you know, I  
6 don't think we want to go there.

7 MR. AHMED: I was going to mention the  
8 same thing, Mike. I don't think you can dictate  
9 to commercial customers, they don't want to be  
10 shut down. Certain customers may not want to be  
11 shut down for any reason under any circumstances,  
12 so therefore it cannot be mandatory, it could be  
13 voluntary.

14 And I think it could be tariff based,  
15 which could be mandatory. If you elect this  
16 tariff, then it's mandatory, you know, something  
17 like that.

18 MS. BENNINGFIELD: Yes, the condition of  
19 the tariff. Yes, Cal?

20 MR. BROOMHEAD: Which is another way to  
21 it, if the tariff is mandatory and you have to buy  
22 the hardware. The tariff is available now. The  
23 CEC has just paid to have smart meters installed  
24 in all the buildings over 200 KW. I know that  
25 several hundred of them went into San Francisco,

1 and we're going to try and get them to activate  
2 that.

3 I think there's certainly an issue of  
4 what kind of facility it is, and what kind of  
5 loads we're talking about reducing on an on-call  
6 basis.

7 And as far as, I mean I think there are  
8 other ways you can structure the incentive and  
9 having a tariff which is actually beneficial for  
10 them to do it, which has to be proven in the pilot  
11 I think that's been approved by the CEC.

12 But also to think of the other triggers  
13 that are on this list, alternate sale and lease,  
14 as a way of getting to it. But maybe think of it  
15 as kind of an option, if you buy into one item  
16 that we want to get on this list, or any package  
17 of them, or -- you can opt for that, or you can do  
18 demand reduction.

19 MS. BENNINGFIELD: It's like an offramp.  
20 You can do this, here's another offramp.

21 MR. BROOMHEAD: Right. If you don't  
22 like that, then you can do this. Then at least  
23 they're given options, but some buildings will buy  
24 into it, and you get some demand reduction out of  
25 it.

1 MS. BENNINGFIELD: A choice of mandates.

2 MR. BROOMHEAD: And on a residential  
3 level, in San Francisco we don't have any air  
4 conditioning loads so it's actually -- I'm  
5 actually interested in electrical resistance  
6 heating in our winter peak, because that's where  
7 we have an additional problem.

8 You know, we were talking earlier about  
9 what kinds or requirements for air conditioning, I  
10 mean do you change it out, or what do you do to it  
11 during the trigger. And maybe that's an option,  
12 well if you don't want to replace this old,  
13 decrepit equipment, then you have to be on this.  
14 And then it becomes a matter of choice.

15 MR. GUSTAVSON: I think one of the most  
16 powerful ways to get an air conditioning load  
17 through this vehicle is to make sure that the -- I  
18 think we can get further on energy savings if the  
19 control algorithms involved when the utility  
20 triggers changes the set point of the air  
21 conditioning, as opposed to shedding it.

22 And I know there's some programs in  
23 different parts of the country where, on the  
24 residential side, that's being done. Whereas, you  
25 know, once upon a time we tended to turn things

1 off in those programs, now they're sending a  
2 signal to a smart staff that raises the set point  
3 by four degrees or six degrees.

4 And I think it's much easier to sell as  
5 an option, even in the commercial sector, than  
6 something where demand control shedding programs  
7 are in place. And I think if they aren't, most  
8 control systems are certainly capable of doing  
9 that.

10 And I don't know where tha goes along  
11 with the scenario that you're talking about, but  
12 it's a far better strategy and one that you might  
13 be able to regulate further than shedding.

14 MR. RIEDEL: This is Randel Riedel. I'd  
15 be happy to share the information that's coming  
16 out of two pilots that I'm managing in the  
17 residential sector, specifically on demand  
18 response.

19 And additional education to the  
20 homeowner as to issues of energy efficiency. so  
21 I'll supply that when we get the final reports  
22 from those two projects.

23 MR. BROOMHEAD: Can I add that, I get  
24 personally upset when I think of using air  
25 conditioning in a 5,000 square foot home that's

1 occupied by four people somewhere, compared to me  
2 with my family of four living in an 1,100 square  
3 foot home in San Francisco.

4 Making the air conditioner more  
5 efficient is one thing, but downsizing the  
6 existence of the entire building would be a great  
7 boon to making the whole thing more efficient, and  
8 maybe controlling the amount of conditioned space  
9 that they're allowed to have would do something,  
10 or incentivized to have would do something, to  
11 eliminate some of that.

12 MR. PIERCE: Could you live in a less  
13 than 1,100 square feet?

14 MR. BROOMHEAD: I do. We went from 900  
15 to 1,100, that was an upgrade.

16 MS. BENNINGFIELD: I think Marin County  
17 has done something in that regard, that you cannot  
18 build a house that uses more than this house times  
19 the allowable energy of this house. If you want  
20 your house bigger then you have to compensate some  
21 other way.

22 MR. BROOMHEAD: I'll have to call them.

23 MS. BENNINGFIELD: Yes, so you'll need  
24 to call them.

25 MR. BROOMHEAD: Although that doesn't

1 typically happen in San Francisco, because space  
2 is at such a premium. You pay for the land, not  
3 the building.

4 MR. QUINN: All that empty nesting.

5 MR. HODGSON: I was just curious,  
6 Randel, what's the timing of those projects that  
7 you're working with on kind of consumer demand and  
8 pricing. Are the reports coming out in a year, or  
9 six months, or --?

10 MR. RIEDEL: Yes, we should have then  
11 between three to six months, so I'll send you  
12 copies.

13 MR. HODGSON: I'm real curious about how  
14 that's going, that's such a big issue out in the  
15 marketplace, and I'd love to know what's going on.

16 MR. RIEDEL: Okay, well, we'll talk  
17 about it.

18 MS. BENNINGFIELD: Can I ask you a  
19 question, Mike? In that area where they are  
20 required to have these controls, how are the HVAC  
21 contractors dealing with it? Are they putting in  
22 larger systems, are they concerned about  
23 callbacks, or --?

24 MR. HODGSON: Lynn, it's actually just  
25 come up.

1 MS. BENNINGFIELD: Okay.

2 MR. HODGSON: The homes themselves are  
3 just under construction, and I don't know the  
4 answer. I didn't even think about, boy if we had a  
5 four ton load we better put in a five ton. I  
6 didn't even think of that, and I don't know if  
7 that thought process has occurred.

8 In the Title 24 work that was done, and  
9 they actually did have HVAC designed loads, and  
10 they are, you know, correctly sized units, I would  
11 anticipate that they are not oversized. You know,  
12 they are sized appropriately. But I don't know  
13 the answer to that.

14 MS. BENNINGFIELD: Okay. I'd be  
15 interested in whatever, when the data comes out  
16 next summer or whenever. Okay, any comments on  
17 the special tariffs and demand response programs?  
18 We got into that quite a bit already, and there is  
19 now forthcoming in three to six months which we'll  
20 try to point to in our final report. Any final  
21 comments on that issue?

22 Okay, let's move on into the last one,  
23 which is encouraging and facilitating the  
24 development and adoption of model retrofit  
25 ordinances. And we have the key person with us

1 today to talk about that.

2 Our idea here is that, looking at a time  
3 of sale mandate, a good proving ground might be  
4 locally adopted ordinances. And it's possible  
5 that more localities have not adopted ordinances  
6 because they don't have the technical work behind  
7 it to support it, to promote it, to change the  
8 political climate.

9 Or they don't have the political will to  
10 do it in their community. But some of these  
11 barriers could possibly be moved with technical  
12 assistance from the state.

13 If the state were to produce like a  
14 local ordinance tool kit or something similar that  
15 said, here's some good ideas to include in your  
16 ordinance, here's some suggested working for the  
17 ordinances, here's some cost-effective analysis  
18 tailored to your particular climate zone and your  
19 particular mix of buildings.

20 If assisting them in this way with the  
21 technical information might facilitate more  
22 frequent adoption, and then the state could track  
23 the effectiveness of the programs, learn from  
24 them, and then perhaps down the road look at a  
25 statewide mandate.

1           So that's the thinking, it's sort of a  
2   bottom up strategy instead of a top down strategy  
3   in terms of getting a mandate going. So are there  
4   any comments on that particular issue, merits or  
5   barriers. Yes, Mike?

6           MR. HODGSON: I think Cal has a good  
7   case study that it sounds like we need to learn  
8   more about. The city of Davis has had an  
9   ordinance for about 20 years on the retrofit  
10   market, we should learn more about what they've  
11   done and how successful it's been.

12           It would be good to contact the local  
13   government group -- what is it called, I can't  
14   remember?

15           MR. BROOMHEAD: Local government  
16   commission.

17           MR. HODGSON: The local government  
18   commission and ask them if they have sample model  
19   ordinances. They have a fairly active energy, a  
20   couple of consultants. And there may be something  
21   like that out there already. I think it's a great  
22   idea if you give them a model ordinance.

23           City councils tend to adopt things like  
24   this without really realizing the consequence.  
25   They're already elected, and then boom, then

1 things happen. So, you know, it's a good testing  
2 ground.

3 I think that'd be -- look at some that  
4 have actually worked, and maybe Cal's is an  
5 example and needs to be improved, or it's a good  
6 idea. "We ran into these barriers, I don't know  
7 what they are."

8 I would think there would be a Davis  
9 person here. No? I know I lived in Davis as a  
10 student, that was a long time ago. But at that  
11 time they had a retrofit ordinance.

12 MR. BROOMHEAD: Yes, I used to work as a  
13 weatherization contractor under the Berkeley RICO  
14 ordinance, and Berkeley adopted a SECO based on  
15 San Francisco's commercial ordinance. And they  
16 got theirs running just as ours was dying.

17 I think one of the key differences as to  
18 why the RICO worked and the SECO didn't work --  
19 and I said before about the problem about the  
20 building inspection not really wanting to enforce  
21 it -- whereas RICO, the actual enforcement point  
22 was whether the recorder would record the deed.

23 And to them it was just a checkmark, you  
24 know, do I check the box because the certificate  
25 is in the stack of things that are stapled in the

1     stack of stuff, or not. And it's just a clerk --  
2     "oh, it's not there, I can't do it."

3             MR. HODGSON: You can't record it if you  
4     can't find it.

5             MR. BROOMHEAD: Exactly. So the  
6     Planning Department was keyed with tracking and  
7     providing all the support work, and they got the  
8     lion's share of the \$15 filing fee for this little  
9     certificate, but it had a point of enforcement  
10    mechanism that was so simple that it was a very  
11    solid way of moving forward.

12            Whereas with a building inspection it  
13    depended on a much more proactive administrative  
14    structure to make it happen. And so I think --  
15    but I really applaud the idea of working with  
16    local governments on developing retrofit type  
17    ordinances or any kinds of ordinances.

18            We're considering looking at buildings  
19    that are, you know, 500 KW or one megawatt and up,  
20    and putting on certain restrictions as  
21    requirements on them for performance verification  
22    periodically, for making sure that their T-12 to  
23    T-8 retrofits are done. Kind of the basic stupid  
24    stuff that everybody should be doing, and there's  
25    support from BOMA for doing that.

1           And that's a different sort of thing as  
2    "do you want to occupy a building in San Francisco  
3    and it's this size and that's what you have to  
4    do." And after we get that established then maybe  
5    work it down through the sizes so that we're  
6    getting to smaller and smaller buildings, but for  
7    those large buildings they have staff that are  
8    there.

9           When you go to smaller buildings that's  
10   a different issue. There's nobody there. There's  
11   nobody even there in some buildings to fix the  
12   door knobs when they break, they've got to call  
13   somebody to come over. So it's harder to get at  
14   those buildings.

15          But anyway, just to support the idea of  
16   working with local governments. Because I think  
17   that the structure of local governments, how  
18   departments are organized, how they're populated,  
19   who are the people that are in there, characters,  
20   how the local city structure is organized, is  
21   going to have an impact on really the best way to  
22   enforce something. And that's going to have an  
23   impact on the design of the program.

24          MR. HAMILTON: Something similar, I  
25   don't know if it was mentioned in the report, was

1 the CEEP program. I mean, it's been really  
2 successful on the new construction side. Could  
3 you design something similar, since you have the  
4 framework already and it's a proven product.

5 It's, you know, cities are accepting it  
6 or adopting it. Designing something along those  
7 lines for the existing side.

8 MS. BENNINGFIELD: Good suggestion.  
9 Yes?

10 MR. HODGSON: Tom, we have our advisory  
11 meeting next Tuesday, and I can just float the  
12 idea of how we would take the CEEP program in the  
13 new construction market, and move it into the  
14 retrofit. When do they think it's a good idea.

15 Now recognize that the local  
16 representative here is typically the building  
17 department or the planning department. But if we  
18 could push all the honus down to the recorder, and  
19 it's a check the box, I mean the building  
20 department would sign off on that in a heartbeat  
21 because they don't have to do the enforcement.

22 You know, there are 71 jurisdictions in  
23 the program now, and there's a lot of people with  
24 a lot of input. So I'll float the idea. It's  
25 kind of a busy agenda, but it sounds like a good

1 lunch topic. I could start probably --

2 MR. HAMILTON: Yes, because that's not  
3 what you file with the Legislature. If it is  
4 acceptable to the group you have potentially 71  
5 pilot cases for existing housing.

6 MR. BROOMHEAD: That's scary.

7 MR. HODGSON: Well, if you could design  
8 a model ordinance that was fairly simple, and had  
9 a simple check the box enforcement, that has a  
10 couple of jurisdictions that are willing to try  
11 it -- that's how CEEP started, a couple of people  
12 tried it.

13 And then other building officials  
14 started talking to those building officials and  
15 found that it was advantageous with their  
16 relationships with the building community to do  
17 that. So, you know, after that it just took off.  
18 And that's what you want is success.

19 And a model ordinance, if you could get  
20 100 jurisdictions to adopt a model ordinance, and  
21 then CAR has a really more difficult time opposing  
22 something like this on a statewide basis --

23 MR. BROOMHEAD: Too many meetings to go  
24 to.

25 MS. BENNINGFIELD: Yes, you'd have

1 momentum.

2 MR. PIERCE: I'm wondering too is there  
3 an opportunity to learn from a past failure. I  
4 think -- Cal, did you mention that you worked on a  
5 program in the city of Berkeley that was on its'  
6 demise or failed?

7 MR. BROOMHEAD: No, in San Francisco the  
8 commercial ordinance failed. We're going to try  
9 and reinstitute it. I'm in the process of  
10 dredging up all the old reports and everything,  
11 and when I have it all in front of me then I'll  
12 pass it on.

13 MR. PIERCE: Does Berkeley still have a  
14 retrofit ordinance for energy?

15 MR. BROOMHEAD: Berkeley's is working,  
16 and I haven't talked to Neil to find out how it's  
17 going, but I will be soon. In fact we've been  
18 meeting with the, kind of the California cities  
19 coalition, I forgot what our informal name is, but  
20 the local government commission has been  
21 sponsoring a series of meetings, and the next one  
22 I believe is in Santa Monica the first week of  
23 December.

24 But what we're going to be talking about  
25 is laying out a couple of different topic areas of

1 things that cities and counties can do. And two  
2 of the things that were mentioned were ordinances  
3 and small business programs.

4 So we're going to have some special  
5 sessions about different topic areas, and I'll  
6 just try to get the one on ordinances happen  
7 sooner than later, and then we can pass that  
8 information on to this group.

9 MS. BENNINGFIELD: Would it be  
10 beneficial to have support from the state or  
11 utilities in evaluating and monitoring these  
12 pilots as well?

13 MR. BROOMHEAD: That would be great. I  
14 would love to have some support to go and look at  
15 the records from our own planning department.  
16 Because I don't know how many -- in 1992 we had  
17 gathered a report, because we had support from  
18 LBL.

19 And they looked at the eight years or so  
20 of the ordinance that 15,000 homes had been  
21 certified under the RICO, but I don't know where  
22 we are now. And we haven't done phone search, or  
23 done any site visits or anything to see how it's  
24 being enforced at this point in time.

25 MS. BENNINGFIELD: Or to see how much

1 energy it's actually saving?

2 MR. BROOMHEAD: That would be another  
3 whole piece of work.

4 MS. BACHRACH: Devra Bachrach. Just for  
5 the purpose of coordinating, I wanted to just  
6 alert you to the fact that PG&E and the city of  
7 San Diego submitted a proposal to the Public  
8 Utilities Commission as part of the 04/05  
9 solicitation process that does propose to explore  
10 RICO and SECO's ordinances for -- and I think  
11 Silicon Valley.

12 So it might be worth talking to them as  
13 well as, you know, if they are funded and do start  
14 that process.

15 MR. BROOMHEAD: Is it San Diego, or--?

16 MS. BACHRACH: No, San Jose.

17 MS. BENNINGFIELD: Oh, okay.

18 MR. CENICEROS: Thank you, Devra, we  
19 didn't know about that.

20 MR. AHMED: The question I have is, your  
21 discussion on local ordinances, are you thinking  
22 only about only for suggesting certain ordinances  
23 and changes in the standards for retrofit, or some  
24 of these ideas that we talked about today to be  
25 included into the local ordinances?

1 MS. BENNINGFIELD: No, the first. They  
2 would look at what kinds of measures make sense.  
3 We would help them figure out what kinds of  
4 measures make sense to be required.

5 MR. AHMED: But only during retrofit?

6 MS. BENNINGFIELD: Only at the time of  
7 sale.

8 MR. AHMED: At the time of sale, okay.

9 MR. QUINN: If you will look at what I  
10 just gave you, page two it says "the underlying  
11 automated schema?" On page three, under item two,  
12 in regards to standby power generation for non-  
13 essential systems, go to the next paragraph, it  
14 says "underlying automated schema capability."

15 The city of San Diego, the county of San  
16 Diego, is now looking at these particular modeling  
17 capabilities. And in that context, the next few  
18 pages, if you look at the bottom line, it says CBS  
19 2012. CBS 2012 stands for the Cypher Building  
20 System that is proposed or the entire national  
21 tool for the United States.

22 And the standard integrator models or  
23 methodologies, in that context, beyond push, is an  
24 attempt to standardize, at some point of  
25 convergence, in the age of convergence and

1 consolidation, how this is all going to come  
2 about. And all of the questions that I heard  
3 today is essentially covered in the next three  
4 pages.

5 And because San Diego is the key major  
6 city in the state of California under project  
7 2000, please incorporate this in your minutes.  
8 Thank you.

9 MS. BENNINGFIELD: Okay, thank you. Are  
10 there any other comments about retrofit  
11 ordinances? Sounds like we got some very good  
12 ideas and this is a very good path.

13 That's our last topic. So we would like  
14 to open the floor for any other ideas that we  
15 haven't covered today, and then we'll wrap it up.

16 MR. DUDLEY: Yes, Paul Dudley with  
17 Bristolite Industries. I'm still, I guess,  
18 unclear about maximized daylighting on the chart  
19 here for retail buildings. And we have only  
20 grocery checked and not warehouses. The 2005 only  
21 covers newer construction, is that correct?

22 MS. BENNINGFIELD: It -- I wish Bill  
23 were here. There's some question on  
24 interpretation in the case of alteration. For  
25 example, if you have an unconditioned warehouse,

1     you install lighting, the lighting is regulated  
2     because unconditioned spaces are now regulated in  
3     2005.

4                 But then if you don't have heating and  
5     air, theoretically the envelope is not yet  
6     regulated. so then when you add the heating and  
7     air system then do you have to go and cut in a  
8     skylight? Or do you have to do some sort of  
9     performance run to justify that you don't need the  
10    skylight?

11                MR. DUDLEY: Okay.

12                MS. BENNINGFIELD: So, you know, I know  
13    that doesn't fully answer your question, but just  
14    to let you know that there are some outstanding  
15    issues with the implementation on the skylight  
16    issue for 2005. And they are supposed to apply to  
17    new buildings, but that's not to say that in  
18    certain cases they might not apply to existing  
19    buildings.

20                MR. DUDLEY: I understand that, and that  
21    has to do with mostly warehouses, right? But what  
22    about the other retail, it deals with them also?

23                MS. BENNINGFIELD: Yes, any building  
24    that meets the 15,000 foot 25,000 square foot  
25    criteria. It does it regardless of the occupancy

1 for the 2005.

2 Now, for the purposes of our table,  
3 basically we're open to suggestions. You've said  
4 retail should be included, so we'll look at that.  
5 And any other occupancies where skylights are  
6 typically cost-effective that we've overlooked, we  
7 would like to know about that as well.

8 MR. DUDLEY: Well, of course only  
9 factories that are -- I'm sorry, as having one and  
10 a half watts per square foot, like those.

11 MS. BENNINGFIELD: Do you deal with the  
12 residential market at all?

13 MR. DUDLEY: I don't personally, no.

14 MS. BENNINGFIELD: Okay, because we had  
15 a comment that typically in residences they  
16 actually end up using energy instead of saving  
17 energy, in a lot of cases.

18 MR. DUDLEY: Quite possible.

19 MS. BENNINGFIELD: So we have to be very  
20 careful when we look at daylighting and  
21 particularly top lighting in residences.

22 MR. DUDLEY: Right. Thank you.

23 MS. BENNINGFIELD: Okay. Any other open  
24 issues to discuss?

25 MR. QUINN: Can I finish up one item,

1 when I got interrupted. Item 1.02, because that's  
2 exactly why we're here today, if I could just --.  
3 Item 01.02, web services flow language. There's  
4 been a dramatic change in that particular  
5 reference.

6 And anything and everything you've read  
7 over the last 24 months with respect to web  
8 services between CORBA and the ORB languages have  
9 now been subject to a very dramatic issue that was  
10 incorporated into the computer web services of  
11 October 2003, defining inter-operability.

12 And it sets forth the very precise  
13 nature of the messaging we're all going to be  
14 concerned with in the convergence between old  
15 buildings and new buildings. So anything to do  
16 with the eventual equalization, which is the  
17 charter of the national tool to accomplish, is  
18 incorporated in this magazine as it relates to web  
19 services.

20 So please go to your local library if  
21 you don't subscribe to this particular IEEE  
22 computer society. And it's listed on page --  
23 well, there's three or four pages here, but in  
24 particular the realtime symposium on embedded  
25 technology will be held in Toronto, Canada on May

1 25th through the 28th next year.

2 But the particulars of the orchestration  
3 of web services is on page 46. Everything I have  
4 discussed here today for control management of  
5 systems on a chip, for those that have yet to be  
6 installed either proposed, new, or in those that  
7 are to be completely retrofitted. And turning  
8 software into a service, as I have known it in the  
9 past 47 years in the work I have been doing in  
10 advanced standards.

11 And then the particular item, web  
12 services flow language and semantics, which our  
13 friends at Microsoft notified the entire world  
14 would be cut off as of June 30th, 2002. This now  
15 defines, on page 35, --

16 MR. CENICEROS: Mr. Quinn, I'm sorry, we  
17 don't have time to go through the literature here  
18 at the table.

19 MR. QUINN: Well, I'm ending if I may  
20 please?

21 MR. CENICEROS: Okay, wrap up, and we'll  
22 refer to the publication.

23 MR. QUINN: This is critical. The web  
24 services to be defined in the definition on the  
25 linkage is all contained on page 35. Thank you.

1 MS. BENNINGFIELD: Thanks for the  
2 resource.

3 MR. CENICEROS: Are there any other  
4 comments about focused areas that we haven't  
5 outlined in these five that you'd like to bring to  
6 our attention, or other comments?

7 MR. HODGSON: Bruce, I'd like to go back  
8 to my comments kind of at the beginning of the  
9 discussion. What I really would like to see and I  
10 think would be very helpful is trying to determine  
11 where the potential energy savings can be, and  
12 Commissioner Rosenfeld brought back, it sounds  
13 like, the residential and commercial energy  
14 potential studies.

15 And I think it would be nice to be able  
16 to kind of lay that out and say "here's the big  
17 opportunities." On the big picture I also think  
18 we need to expand some participants. Randel  
19 mentioned CAR, Randel needs to drag them in here  
20 kicking and screaming if he can.

21 I think we need to invite BOMA here,  
22 because they are very important because  
23 economically they would get this, they would  
24 understand that this is good for their membership.  
25 I don't know if they'd go along with it

1 politically, but economically it makes sense.

2           And then I think my perception is this  
3 is a very big thing to do. We haven't been able  
4 to crack this nut for a long time. So we have to  
5 start simply. I like the Big Six idea, or maybe  
6 it's the Big Three.

7           If you're going to propose some kind of  
8 legislation it's got to be very simple, and then  
9 at the same time do the end-around, and that is  
10 get some model ordinances going, and get some  
11 voluntary participation so you can say it can be  
12 done, here's some successes.

13           And we'd love to help you with that  
14 part, because we think we're pretty good at that.  
15 So that's just kind of global comments, but right  
16 now I'm still looking for what the low-hanging  
17 fruit are. I don't think we have our hands  
18 exactly around what those are.

19           Now we can guess what they are, but it  
20 would be really nice to nail them right through  
21 that saturation or that potential energy  
22 efficiency study, because the Legislature is going  
23 to demand that. They're going to say "if we did  
24 this, this, and this, I want to know what kind of  
25 megawatt savings we're going to get."

1           That's what's going to drive this is how  
2 we can show them that we can prevent crises from  
3 happening that happened previously.

4           MR. CENICEROS: Are there other  
5 comments? We have alluded to the fact that we are  
6 exploring the idea of creating some working groups  
7 in some specific areas. We already have a number  
8 of interested parties.

9           I'm looking at a working group for  
10 commissioning of commercial buildings. And  
11 theoretically we could create a working group  
12 around each of these five focus areas that we just  
13 discussed. We would probably split up the ratings  
14 one into residential and commercial, so that would  
15 be six.

16           I just wanted to get a sense from the  
17 people in this room if you'd be interested in  
18 spending some more concerted and focused time  
19 working in one or more of these areas here, and if  
20 so we'll go ahead and look into that.

21           MR. RIEDEL: Can it be done by e-mail?

22           MR. CENICEROS: Yes, just a show of  
23 hands here? And we don't necessarily need to meet  
24 in person. We can work those details out later.  
25 Conference calling, or working by e-mail by

1 collaborating on documents. And so there's  
2 several people here, great, great.

3           So we'll go ahead and set that up. I  
4 don't think realistically we can get very much  
5 work accomplished before HMG has to have their  
6 report done, well, a draft, in the next 30 days or  
7 so. This is more like an activity that's going to  
8 go into next year, especially as we open things up  
9 to include all the voluntary types of strategies  
10 in addition to the mandatory ones.

11           There will be a lot more things we can  
12 look at then. What we'll then do is look at  
13 what's right next for this particular area --  
14 controls, or commissioning, in terms of  
15 facilitating the transactions that we want to have  
16 happen and improve efficiency in existing  
17 buildings more, in the market.

18           As well as removing institutional  
19 barriers or transaction barriers through  
20 regulation, or even requiring specific things be  
21 done in existing buildings at certain triggers.

22           So, we'll get into that at the beginning  
23 of next year. So, let's see. I guess we should  
24 remind you also, these one page forms with the  
25 measures. We know they're not perfect, but we

1 heard a lot of feedback, specific ideas in terms  
2 of ways we can improve this in terms of adding  
3 additional things to it.

4           So you're invited to think about this  
5 some more, mark it up more, and send it into us or  
6 fax it to us, or leave it with us before you leave  
7 today. Also, if you haven't signed in yet, I know  
8 there were a couple of you that came in later this  
9 afternoon. We have a signup sheet outside. And  
10 that way we can notify of future activities for AB  
11 549.

12           And anything else?

13           MS. BENNINGFIELD: Do we have any  
14 comments? Yes, Tom?

15           MR. HAMILTON: When do you think they'll  
16 have the draft report done? Is that January,  
17 February you're shooting for?

18           MR. CENICEROS: Which draft report are  
19 you referring to?

20           MR. HAMILTON: I guess the draft to the  
21 Legislature?

22           MR. CENICEROS: Okay. There's two  
23 reports to the Legislature we need to talk about.  
24 The Legislature requires a report by January 1st,  
25 2004. And we didn't start until a year and a half

1 after the legislation was passed due to the peak  
2 load crisis and other programs we were doing, and  
3 lack of staff and budget and all that.

4 So we are going to submit an interim  
5 report by January 1st. The draft report will be  
6 considered by the Energy Commission in early  
7 December. It will be available in mid-November or  
8 so for public review. And that's basically going  
9 to just, talk about our progress essentially, and  
10 probably won't have a lot in terms of  
11 recommendations of things we can do right now.

12 If any of you think there are things we  
13 should recommend now that are ready for action by  
14 the Legislature, we invite you to let us know,  
15 either now or by e-mail or call us up. And we'll  
16 consider those things. But we're very early in  
17 the process of our analysis, so we don't expect  
18 there to be --

19 MR. HAMILTON: Tom Hamilton. The point  
20 that Michael brought up about beginning or re-  
21 beginning, I guess, the phase two HERS regulations  
22 for existing housing. I mean, that's not  
23 dependent upon any reports or anything like that.

24 And that could be something you could  
25 put into your interim report, saying long-term,

1 short-term strategies, and here are things that  
2 we've already begun. As opposed to saying "well,  
3 we've got to wait until next year to start some  
4 stuff."

5 MR. CENICEROS: I think I can guarantee  
6 you we'll say something about the need to finish  
7 the HERS process.

8 (laughter)

9 I don't know if we'll be asking the  
10 Legislature to write a bill or making us another  
11 bill already telling us what to do, but --

12 MR. HAMILTON: You're not going to put  
13 something in there about you have to have one?  
14 Every time a home is sold you require a HERS  
15 report? No?

16 (laughter.)

17 It's not selfish on my part at all, no.

18 MS. BENNINGFIELD: And from our end,  
19 we'll produce our final report in about 30 days.  
20 If I say it on the record then these guys are  
21 going to hold us to it, right? Very soon, yes.

22 MR. CENICEROS: And in the final report  
23 to the legislature, the comprehensive one that'll  
24 have a whole host of recommendations, will go to  
25 them October of 2005. There will be a draft

1     probably two or three months before that that  
2     we'll be working on over a period of time with  
3     lots of input from everyone. So, that's more than  
4     a year away.

5             MR. HAMILTON: Just a general question.  
6     Have you thought of other things that can be  
7     done -- and I don't know if you can because of the  
8     regulatory process -- implement approaches sooner  
9     than October '05? I mean, not necessarily to  
10    phase two, but particularly some local  
11    requirements or something like that.

12            Something sooner rather than later, you  
13    know, just because of how long the bill has been,  
14    and -- I don't know, I mean I was just wondering  
15    if there was any --

16            MR. CENICEROS: We think there are a lot  
17    of things that don't require action from the  
18    Legislature that we can start moving on. And  
19    we've already got some good ideas, just in the  
20    process of this first phase, that really only  
21    require talking between different parties who have  
22    control over those processes, and getting them to  
23    think about making these incremental improvements.

24            So, yes, there's a lot of stuff I think  
25    will spin out of this process, and I think people

1 can then run with those balls as we go. And we  
2 hope you will point out some of those  
3 opportunities if you are thinking of any in  
4 particular.

5 MR. HAMILTON: I just think it would be  
6 nice -- well, just because of, in supporting the  
7 sponsors of AB 549. Just because of the work CBIA  
8 has done on the new side, it would be nice to  
9 finally do something on the existing. And I know  
10 there's a lot of issues involved, but -- that's  
11 the only reason I was asking.

12 MR. CENICEROS: Cal?

13 MR. BROOMHEAD: I'd like to offer the  
14 city and county of San Francisco as a pilot  
15 project for anything that this group decides to  
16 move forward on. I want to lend you resources to  
17 that. I'll put some effort into collecting  
18 whatever local data we can find, and gathering the  
19 political support and trying to push something  
20 through.

21 MR. CENICEROS: Right, and that reminds  
22 me too, we have discussed the need for some kinds  
23 of concepts to pilot test them first. And it may  
24 be a technological thing that you're trying to  
25 test, or it may be a market system that you're

1     trying to test, you know, whether it would be  
2     feasible, whether it would really work.

3             And that's one great way to do it. And  
4     we will look at other types of things that would  
5     require pilot testing before we could ask the  
6     Legislature to require something statewide. That  
7     may not be appropriate for a local government to  
8     do, it may be a smaller or a different kind of  
9     cross-section in the market. Devra?

10            MS. BACHRACH: Devra Bachrach. I have a  
11     question about your next phase in this project,  
12     looking at the voluntary strategies. How does  
13     that relate to, and how are you coordinating with  
14     the process underway at the PUC now that's, I  
15     think, looking at similar issues?

16            MR. CENICEROS: Yes. We are going to be  
17     actively participating in their workshops, and  
18     they are holding five or so, is that right,  
19     between now and probably February or June of next  
20     year, if it goes longer.

21            And their process is basically to look  
22     at is there more we should be doing for energy  
23     efficiency in all facilities statewide, meaning  
24     focusing on what they have control over, which is  
25     the investor-owned utility programs.

1           And so there's going to be a lot of  
2   information-sharing both ways. We've been in  
3   touch with the PUC staff, and we'll be doing some  
4   studies that have some common overlap in there,  
5   and we'll both be utilizing the results of that.

6           We'll have to kind of see how this thing  
7   lays out, because I don't want to have a workshop  
8   that goes over all the same questions that they  
9   covered in one of their workshops too, so --

10          MS. BENNINGFIELD: I believe they're  
11   also, I understood they're looking statewide, not  
12   just the IOU's. I know that Commissioner Kennedy  
13   cued it up that way.

14          MR. CENICEROS: Good, good. So we will  
15   be looking at it. Thanks for bringing that to our  
16   attention. Any other comments? Questions?

17          We'd like to thank you once more for  
18   coming and giving us your valuable time, and check  
19   our website for the transcripts if you want to  
20   look that over, and the draft of the next HMG  
21   report in about a month, a month and a half or so.

22          MR. RIEDEL: And there'll be an e-mail  
23   list of everybody's e-mail who attended available.

24          VOICE: I believe it's posted on the  
25   website.

1 MR. RIEDEL: Okay, great, great.

2 MR. CENICEROS: Yes. Okay, thank you.

3 Drive carefully. We're off the record.

4 (Thereupon the workshop ended at 4:45 p.m.)

## CERTIFICATE OF REPORTER

I, ALAN MEADE, an Electronic Reporter,  
do hereby certify that I am a disinterested person  
herein; that I recorded the foregoing California  
Energy Commission Workshop; that it was thereafter  
transcribed into typewriting.

I further certify that I am not of  
counsel or attorney for any of the parties to said  
workshop, nor in any way interested in outcome of  
said workshop.

IN WITNESS WHEREOF, I have hereunto set  
my hand this 27th day of October, 2003.

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345
